### **Hong Kong Sensorall International Limited Profile**

Hong Kong Sensorall International Limited utilizes state-of-the-art silicon micromachining technology to manufacture OEM/ODM components for physical measurement and control.

These products include pressure sensors, force sensors, transducers and custom design for one stop solutions. Silicon's excellent semiconductor properties have made it the basic building material of the electronics industry. But silicon also has excellent physical properties that make it an ideal building material for mechanical devices. Silicon has a tensile strength greater than steel and is almost perfectly elastic, making it a wonderful material for use in MEMS products. It is free of hysteresis, and its crystalline structure is wellsuited to the fabrication of miniature precision products. These silicon micromachined products have several advantages over their conventionally manufactured counterparts: they are generally much smaller, their performance is higher due to the precise dimensional control in the fabrication, and costs are lower because thousands can be produced at one time.

While Sensorall products have been technology leaders, the Company's real strength has been in bringing products to market. Today, Sensorall offers the broadest line of micromachined pressure sensors, force sensors, tranducers and custom design in the industry.

Silicon micromachining is a powerful outgrowth of semiconductor process technology. Integrated circuit manufacturing techniques are supplemented by silicon etching processes to create very precise, miniature mechanical structures. These silicon microstructures can have electronic features that allow physical inputs to be converted into electrical signals. Similarly, electronic signals can be applied to these devices to provide control functions.

Silicon is the material of choice due to its unique combination of excellent electronic and mechanical properties. Silicon has the hardness of steel, the thermal conductivity of diamond, exhibits piezoresistive properties, is lightweight, has low thermal expansion, and is relatively inert.

Unprecedented dimensional control can be achieved through the use of conventional processing techniques, which also open up the possibility of large scale batch manufacturing, enabling very low cost devices to achieve extraordinary performance levels. Structures that can be fabricated with silicon micromachining include purely mechanical structures in addition to sensors and transmiters. Silicon micromachining provides a higher level of dimensional control than can be obtained from traditional machining or molding technologies. The most significant benefit, however, is the capability to combine these precise mechanical structures with electronic features to create sensors and transmitters. The capability to design new devices and processes using this base technology is our primary strength. Our experience in transferring state-of-the-art designs into manufacturing is excellent in the world.

### **UNMATCHED BREADTH OF PRODUCT LINES**

Sensorall has developed and commercialized three product areas based on silicon micromachining technology, offering an unmatched range of standard products with a strong custom design capability. Pressure sensors were the first products produced by the Company. A broad range of package styles is available, including PC Board mountable versions, stainless steel housings, disposable medical devices, and complete industrial transmitters.

The second product area for Sensorall involves force sensors. This is the product customized for infusion pumps, syringe pumps,robots, catheters and etc.

The third product line for Sensorall involves custom silicon micromachining. Micromachining technology is applied to meet specific customer requirements.

The advantages of silicon microstructures compared to alternate technologies such as plastic molding, metal machining, or glass drilling are the precision of the etched features, the cost of the batch fabricated component, and the repeatability of the dimensions from part-to-part.

#### Notes:

- (1) All values are Min./Max. and measured at 5V and 25°C unless other specified.
- (2) Best fit straight line.
- (3) Between -125°C and 125°C. Temperature coefficients are typical values at 5V.

#### Wafer OQC

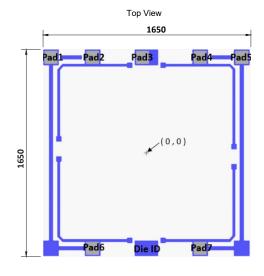

- (1) Sampling die's front-side visual inspection is performed on each wafer following ANSI/ASQC Z1.4 GII AQL 4.0 standard to investigate the defect on metal trace, membrane, and pad areas for quality insurance.
- (2) Full wafer probing test is performed on each wafer to test bridge resistance and offset voltage at 1 atmospheric pressure and room temperature. Either electronic format of wafer map or bad die inking can be provided.

<sup>\*</sup>Pad size = 100 X 100um<sup>2</sup>

## PRESSURE Model SA141

Small size InH20 or PSI Ranges Wide selection of ports

### **FEATURES**

- Small size
- inH20 or PSI Ranges
- · Wide selection of ports
- · Solid State Reliability
- · Absolute or gage pressures
- High-impedance bridge
- · Low power consumption

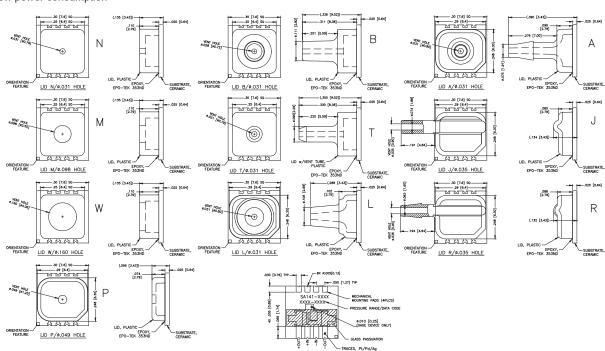

- Absolute or gage pressures
- High-impedance bridge
- Low power consumption

### **DESCRIPTION**

The Model SA141 is a piezoresistive silicon pressure sensor packaged in a surface mount configuration. It is intended for high volume applications where small size, light weight, low cost, and compatibility with automated assembly equipment are required.

The pressure sensor is available with a gage or absolute pressure sensing chip that is attached to a surface mountable ceramic substrate. A cap is attached to the ceramic substrate, protecting the chip and providing the pressure port.

The devices are shipped in plastic anti-static shipping tubes for use with automated production equipment. The drawing shows a standard tube version. Caps are also available with a narrow hole or a large hole to interface with the pressure media.

## PRESSURE Model SA1210

100% Field Interchangeability Constant Current Wide selection of port

- Absolute, Differential or Gage pressures
- Temperature Compensated
- 0.2% Pressure Non Linearity

### **DESCRIPTION**

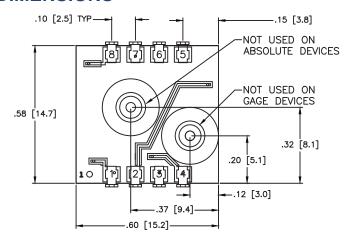

Sensorall International SA1210 Series is a temperature compensated, mV output, ceramic mounted pressure sensor packaged in a rugged Dual In Line package. SA1210 uses a silicon MEMS pressure sensor bonded to a ceramic substrate containing thick film resistors that are uniquely laser trimmed for each sensor.

Incorporating a flexible design, the SA1210 Series is available with no, short or long metal or plastic or ceramic tubes and can be mounted pin up or pins down to allow OEMs to optimize their board design. The SA1210 series is powered using constant current and when configured as in the application note, the integrated gain set resistor will ensure sensor field interchangeability.

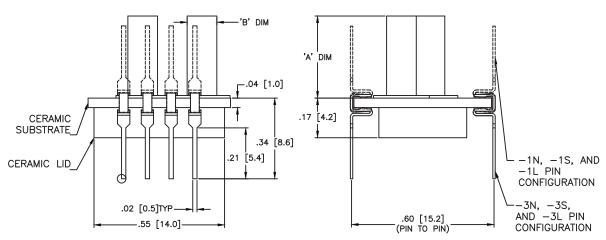

The SA1210 series superior die performance, coupled with rugged ceramic substrate ensures long term stability with superior temperature performance over wide operating range.

## PRESSURE MODEL SA1240

100% Field Interchangeability Constant Voltage Wide selection of port

- Absolute, Differential or Gage pressures
- Temperature Compensated
- 0.1% Pressure Non Linearity

### **DESCRIPTION**

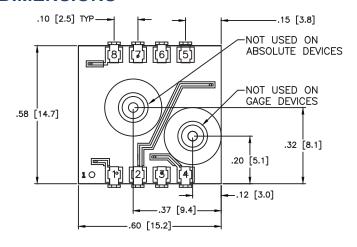

Sensorall International SA1240 Series is a temperature compensated, mV output, ceramic mounted pressure sensor packaged in a rugged Dual In Line package. SA1240 uses a silicon MEMS pressure sensor bonded to a ceramic substrate containing thick film resistors that are uniquely laser trimmed for each sensor.

Incorporating a flexible design, the SA1240 Series is available with no, short or long metal or plastic or ceramic tubes and can be mounted pin up or pins down to allow OEMs to optimize their board design. The SA1240 series is powered using constant voltage and when configured as in the application note, the integrated gain set or current set resistor will ensure sensor field interchangeability.

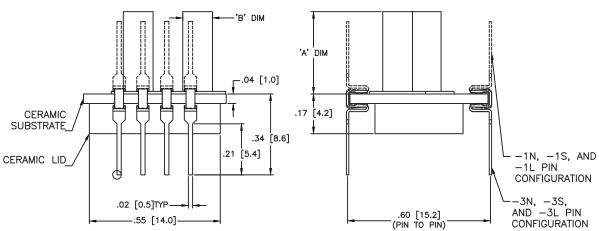

The SA1240 series superior die performance, coupled with rugged ceramic substrate ensures long term stability with superior temperature performance over wide operating range.

#### **Notes**

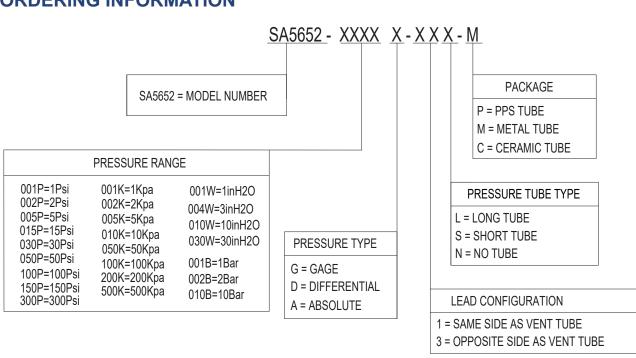

- 1. All specification at reference conditions unless otherwise noted. Output is ratio metric to supply voltage.
- 2. ½ Terminal Base Non Linearity (Measured at 0, 50% and 100% FS). 0.1% for pressure above 1psi, 0.5% for pressure below 1psi, the PNL is tested from the top side of the MEMS.
- 3. Full Scale Span output with sensor only. Field Interchangeability of 1% is guaranteed. Span is 40mV+ for products over 1psi pressure range (include 1psi). Span is 25mV for 1psi below pressure range.
- 4. Deviation between 50°C and 0°C expressed as percentage of reading at 25°C.
- 5. Deviation after 1 year period measured at reference conditions.
- 6. Exceeding Absolute Maximum Specification may damage the device. Extended exposure beyond the operating conditions may affect device reliability.

### **DESCRIPTION**

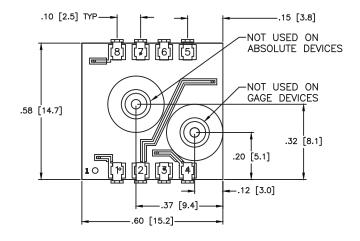

SA13 High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full-scale pressure span and temperature range. SA13 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 1 kHz.

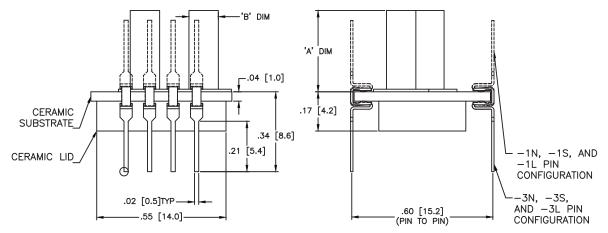

SA13 Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA13 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

### **PRESSURE**

PACKAGE: M (CERAMIC + METAL TUBE)

PACKAGE: C (Ceramic Substrate + Ceramic Tube)

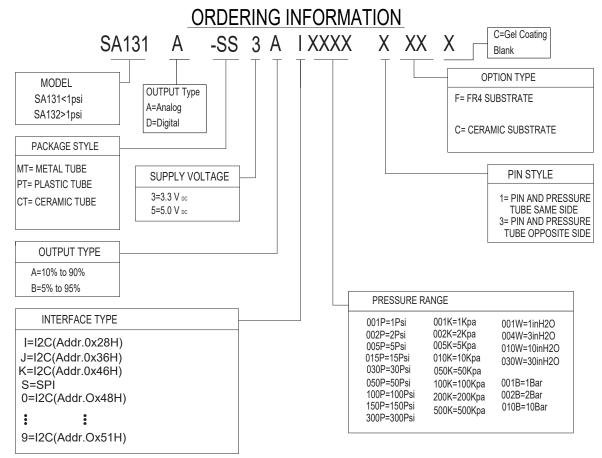

PACKAGE: P (FR4 + PPS TUBE)

### **PRESSURE**

### **MODEL SA13**

### ORDERING INFORMATION

### **FEATURES**

- Various package: SA13 series pressure sensor is designed with various package. Basis substrate is optional with ceramic or FR4 PCB. Pressure port is optional with either ceramic or PPS or metal material.• -20°C to +85°C Compensated Temperature Range
- Small size: 15mm\*15mm compact package.
- Energy efficient: Extremely low power consumption, Supply voltage is 3.3 or 5Volts
- RoHS compliant.(provided by gain set resistor)
- · Absolute, Differential and Gage pressure type.
- Wide variety of pressure ranges: Low pressure from ±1 mbar to±75 mbar, medium pressure from 1psi to 300psi, provide support for many unique applications.
- The 1/8" barbed pressure ports mate securely with 3/32" ID tubing.
- Customer orientation: Accuracy, Total error band and compensated temperature can be customized.
- $\bullet$  Provides the sensor's true accuracy over a compensated range of -10 °C to 60 °C.
- Industry-leading long-term stability: Even after long-term use and thermal extremes, these sensors perform substantially better relative to stability than any other pressure sensor available in the industry today.
- Industry-leading accuracy: Extremely tight accuracy of ±0.25 %FSS BFSL (Full Scale Span Best Fit Straight Line)
- Industry-leading Total Error Band (TEB): Sensorall International specifies TEB—the most comprehensive, clear, and meaningful measurement—that provides the sensor's true accuracy over a compensated range of -10 °C to 60 °C.
- I2C- or SPI-compatible 14-bit digital output (min. 12-bit sensor resolution) accelerates performance through reduced conversion requirements and the convenience of direct interface to microprocessors or microcontrollers;
- $\bullet$  Digital output types can offer 10%~90% output or 5%~95% output for optional.

- 1.Maximum ratings are the extreme limits the device can withstand without damage to the product. Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.
- 2. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 3.The compensated temperature range is the temperature range over which the sensor will produce an output proportional to pressure within the specified performance limits.
- 4.The operating temperature range is the temperature range over which the sensor will produce an output proportional to pressure but may not remain within the specified performance limits.
- 5.Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25 °C Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.
- 6.Orientation sensitivity: The maximum change in offset of the sensor due to a change in position or orientation relative to Earth's gravitational field.
- 7.Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8.Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- 9.Life may vary depending on specific application in which sensor is utilized.
- 10. Contact Sensorall International Sales and Service for detailed material information.
- 11.Total Error Band After Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.
- 12.Working Pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range limits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until pressure is returned to within the operating pressure range. Tested to 1 million cycles, min.
- 13.Overpressure: The absolute maximum rating for pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range. Tested to 10,000 cycles, minimum.
- 14.Burst Pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after exposure to any pressure beyond the burst pressure.
- 15.Common Mode Pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 16.Customized design please contact Sensorall International sales.

### **DESCRIPTION**

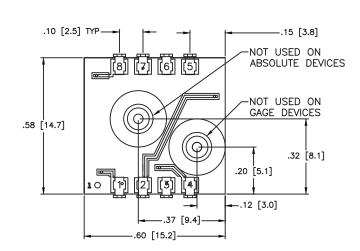

SA5852 High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog and digital output for reading pressure over the specified full-scale pressure span and temperature range. SA5852 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 2 kHz.

SA5852 Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA5852 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

### **DESCRIPTION**

SA5803 High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor, offering an 24bits digital output for reading pressure over the specified full scale pressure span and temperature range. SA5803 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50 Hz. SA5803 Series is calibrated over the temperature range of -10° C to 60 ° C. The sensor is characterized for operation from a single power supply from 1.8 to 3.6 Vdc.

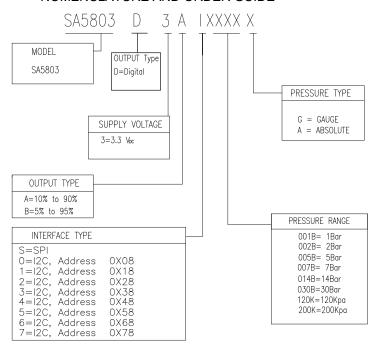

These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA5803 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

### ORDERING INFORMATION

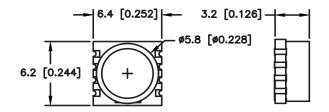

#### NOMENCLATURE AND ORDER GUIDE

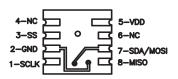

Custom pressure ranges and I2C address are available. Contact Sensorall Customer Service for more information.

### **DIMENSIONS**

#### DIMENSIONAL DRAWINGS & PIN OUT DEFINITION

- 1. Sensors are 3.3 Vdc based on the specification listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- $6. \ Temperature \ output \ option: \ Typical \ temperature \ output \ error \ over \ the \ compensated \ temperature \ range \ of \ -10 ^{\circ}C \ to \ 60 ^{\circ}C.$
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability

PC Board Mountable Pressure Sensor 1-250 PSI 0-100 mV Output Temperature Compensated Low Cost

### **DESCRIPTION**

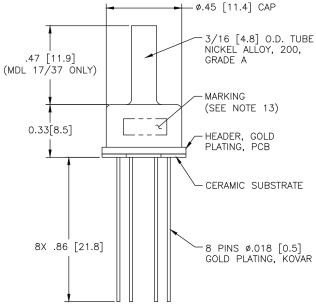

The Model SA16 is a temperature compensated, piezoresistive silicon pressure sensor packaged in TO-8 configurations. It provides excellent performance and long-term stability.

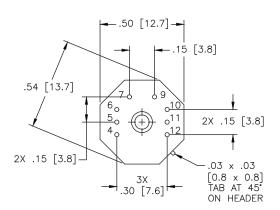

Gage and absolute pressure ranges from 0-1 PSI to 0-250 PSI are available. Integral temperature compensation is provided over a range of 0-50°C using laser-trimmed resistors.

An additional laser-trimmed resistor is included to normalize pressure sensitivity variations by programming the gain of an external differential amplifier. This provides sensitivity interchangeability of  $\pm 1\%$ .

RECOMMENDED MECHANICAL MOUNTING: STANDARD SWAGELOK TUBE FITTING (PLEASE REFER TO SWAGELOK'S WEBSIITE TO SELECT THE ADAPTER FITTING)

PC Board Mountable Pressure Sensor 1-250 PSI 0-100 mV Output Low Cost Temperature Compensated

### **DESCRIPTION**

The Model 26 is a temperature compensated, piezoresistive silicon pressure sensor packaged in TO-8 configurations. It provides excellent performance and long-term stability.

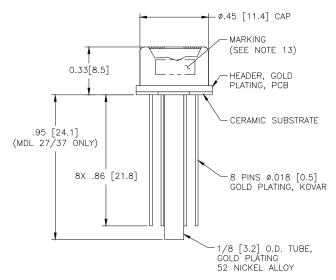

Integral temperature compensation is provided over a range of 0-50°C using a laser-trimmed ceramic compensation board.

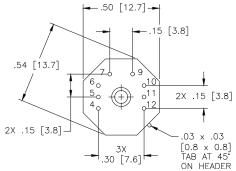

An additional laser-trimmed resistor is included which can be used to adjust the gain of an external differential amplifier and provide sensitivity interchangeability of ±1%.

The Model 26 is available in ranges up to 0-250 PSI. For additional information regarding uncompensated sensors, please contact the factory.

### **DESCRIPTION**

SA18 High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full-scale pressure span and temperature range. SA18 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 1 kHz.

SA18 Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA18 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 90corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

### ORDERING INFORMATION

#### NOMENCLATURE AND ORDER GUIDE

- 1. The transfer function limits define the output of the sensor at a given pressure input.
  By specifying Pmin. and Pmax., the output at Pmin. and Pmax., the complete transfer function of the sensor is defined. See the graphical representations of the transfer function in Figure 2. For other available transfer functions contact SENSORALL Customer Service.
- 2. Custom pressure ranges are available. Contact SENORALL Customer Service for more information.
- 3. See the explanation of sensor pressure types in Table 4.
- 4. See the CAUTION in this document.
- Options T and V are only available on pressure ranges ±60mbar to ±10bar/±6kPa to ±1MPa/±1psi to ±150psi

### **TABLE 4. SENSOR PRESSURE TYPES**

| PRESSURE TYPE | DESCRIPTION  |
|---------------|--|
| Absolute      | Output is proportional to the difference between applied pressure and a built-in vacuum reference.     |
| Gage          | Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure.  |
| Differential  | Output is proportional to the difference between the pressures applied to each port (Port 1 - Port 2). |

### **Notes**

Notes:

- 1. Sensors are either 3.3 Vdc or 5.0 Vdc based on the specification listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of -10°C to 60°C.

  Operation in Sleep Mode may affect temperature output error depending on duty cycle.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

- 1. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range mits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum
- 2. Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range.
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 3. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 4. Common mode pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 5. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 6. Total Error Band after Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage

for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.

#### **DESCRIPTION**

SA18HD High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full-scale pressure span and temperature range. SA18HD Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50Hz.

SA18HD Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 3.3 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA18HD Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### ORDERING INFORMATION

#### NOMENCLATURE AND ORDER GUIDE

- 1. The transfer function limits define the output of the sensor at a given pressure input. By specifying Pmin. and Pmax., the output at Pmin. and Pmax., the complete transfer function of the sensor is defined. See the graphical representations of the transfer function in Figure 2. For other available transfer functions contact SENSORALL Customer Service.
- 2. Custom pressure ranges are available. Contact SENORALL Customer Service for more information.
- 3. See the explanation of sensor pressure types in Table 4.
- 4. See the CAUTION in this document.
- Options T and V are only available on pressure ranges ±60mbar to ±10bar/±6kPa to ±1MPa/±1psi to ±150psi

#### **TABLE 4. SENSOR PRESSURE TYPES**

| PRESSURE TYPE | DESCRIPTION  |
|---------------|--|
| Absolute      | Output is proportional to the difference between applied pressure and a built-in vacuum reference.     |
| Gage          | Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure.  |
| Differential  | Output is proportional to the difference between the pressures applied to each port (Port 1 - Port 2). |

#### **Notes**

- 1. Sensors are 3.3 Vdc based on the specification listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of -10°C to 60°C.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- 9. Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

- 1. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range mits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum
- 2. Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range.
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 3. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 4. Common mode pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 5. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 6. Total Error Band after Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage

for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.

#### **DESCRIPTION**

SA18EC High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full-scale pressure span and temperature range. SA18EC Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 2K Hz.

SA18EC Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 3.3 Vdc or 5.0Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA18EC Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### ORDERING INFORMATION

#### NOMENCLATURE AND ORDER GUIDE

- 1. The transfer function limits define the output of the sensor at a given pressure input.
  By specifying Pmin. and Pmax., the output at Pmin. and Pmax., the complete transfer function of the sensor is defined. See the graphical representations of the transfer function in Figure 2. For other available transfer functions contact SENSORALL Customer Service.
- 2. Custom pressure ranges are available. Contact SENORALL Customer Service for more information.
- 3. See the explanation of sensor pressure types in Table 4.
- 4. See the CAUTION in this document.
- Options T and V are only available on pressure ranges ±60mbar to ±10bar/±6kPa to ±1MPa/±1psi to ±150psi

#### **TABLE 4. SENSOR PRESSURE TYPES**

| PRESSURE TYPE | DESCRIPTION  |
|---------------|--|
| Absolute      | Output is proportional to the difference between applied pressure and a built-in vacuum reference.     |
| Gage          | Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure.  |
| Differential  | Output is proportional to the difference between the pressures applied to each port (Port 1 - Port 2). |

#### **Notes**

- 1. Sensors are either 3.3 Vdc or 5.0 Vdc based on the catalog listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of 0°C to 50°C. Operation in Sleep Mode may affect temperature output error depending on duty cycle.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

- 1. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range mits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum
- 2. Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range.
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 3. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 4. Common mode pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 5. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 6. Total Error Band after Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage

for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.

#### **DESCRIPTION**

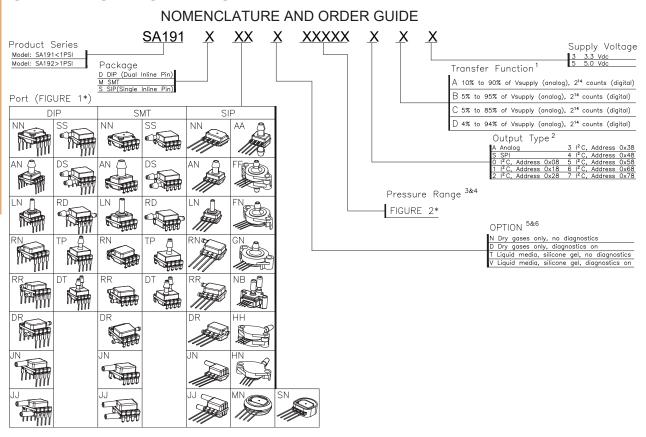

SA19 High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SA19 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 1 kHz.

SA19 Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA19 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### ORDERING INFORMATION

#### **Notes**

- 1. The transfer function limits define the output of the sensor at a given pressure input. By specifying Pmin. and Pmax., the output at Pmin. and Pmax., the complete transfer function of the sensor is defined. See the graphical representations of the transfer function in Figure 2. For other available transfer functions contact SQMEAS Customer Service.
- 2. SPI output function is not available in SIP package.
- 3. Custom pressure ranges are available. Contact SQMEAS Customer Service for more information.
- 4. See the explanation of sensor pressure types in Table 4.
- 5. See the CAUTION in this document.
- 6. Options T and V are only available on pressure ranges ±60mbar to ±10bar/±6kPa to ±1MPa/±1psi to ±150psi

#### **TABLE 4. SENSOR PRESSURE TYPES**

| PRESSURE TYPE | DESCRIPTION  |
|---------------|--|
| Absolute      | Output is proportional to the difference between applied pressure and a built-in vacuum reference.     |
| Gage          | Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure.  |
| Differential  | Output is proportional to the difference between the pressures applied to each port (Port 1 - Port 2). |

#### **Notes**

- 1. Sensors are either 3.3 Vdc or 5.0 Vdc based on the catalog listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of 0°C to 50°C. Operation in Sleep Mode may affect temperature output error depending on duty cycle.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- 9. Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

- 1. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range mits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum
- 2. Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range.
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 3. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 4. Common mode pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 5. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 6. Total Error Band after Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.

## PRESSURE MODEL SA19HD

Anesthesia machines Spirometers Nebulizers Hospital room air pressure

- Variable Air Volume control
- Static duct pressure
- HVAC transmitters
- Clogged HVAC filter detection

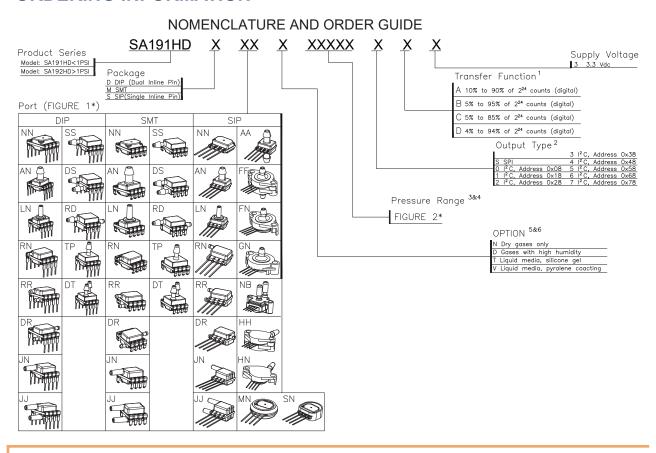

#### **DESCRIPTION**

SA19HD High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SA19HD Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50Hz.

SA19HD Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 3.3 Vdc . These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA19HD Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### ORDERING INFORMATION

### **Notes**

- The transfer function limits define the output of the sensor at a given pressure input.
   By specifying Pmin. and Pmax., the output at Pmin. and Pmax., the complete transfer function of the sensor is defined. See the graphical representations of the transfer function in Figure 2. For other available transfer functions contact SQMEAS Customer Service.
- 2. SPI output function is not available in SIP package.
- 3. Custom pressure ranges are available. Contact SQMEAS Customer Service for more information.
- 4. See the explanation of sensor pressure types in Table 4.
- 5. See the CAUTION in this document.
- 6. Options T and V are only available on pressure ranges  $\pm 60$ mbar to  $\pm 10$ bar/ $\pm 6$ kPa to  $\pm 1$ MPa/ $\pm 1$ psi to  $\pm 150$ psi

#### **TABLE 4. SENSOR PRESSURE TYPES**

| PRESSURE TYPE | DESCRIPTION  |
|---------------|--|
| Absolute      | Output is proportional to the difference between applied pressure and a built-in vacuum reference.     |
| Gage          | Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure.  |
| Differential  | Output is proportional to the difference between the pressures applied to each port (Port 1 - Port 2). |

#### **Notes**

Notes

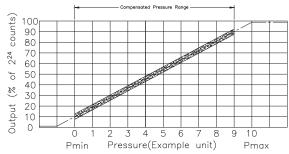

- 1. Sensors are 3.3 Vdc based on the specification listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- $6. \ Temperature \ output \ option: \ Typical \ temperature \ output \ error \ over \ the \ compensated \ temperature \ range \ of \ -10^{\circ}C \ to \ 60^{\circ}C.$
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

- 1. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range mits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum
- 2. Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range.
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 3. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 4. Common mode pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 5. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 6. Total Error Band after Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.

## PRESSURE MODEL SA19EC

Anesthesia machines Spirometers Nebulizers Hospital room air pressure

- Variable Air Volume control
- Static duct pressure
- HVAC transmitters
- Clogged HVAC filter detection

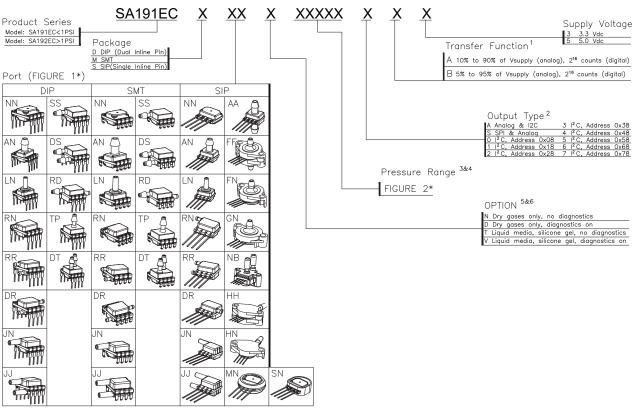

#### **DESCRIPTION**

SA19EC High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SA19EC Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 2 kHz.

SA19EC Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA19EC Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### ORDERING INFORMATION

- 1. The transfer function limits define the output of the sensor at a given pressure input.
- By specifying Pmin. and Pmax., the output at Pmin. and Pmax., the complete transfer

function of the sensor is defined. See the graphical representations of the transfer

function in Figure 2. For other available transfer functions contact SQMEAS Customer Service.

- 2. SPI output function is not available in SIP package.
- 3. Custom pressure ranges are available. Contact SQMEAS Customer Service for more information.
- 4. See the explanation of sensor pressure types in Table 4.
- 5. See the CAUTION in this document.
- 6. Options T and V are only available on pressure ranges

 $\pm 60$ mbar to  $\pm 10$ bar/ $\pm 6$ kPa to  $\pm 1$ MPa/ $\pm 1$ psi to  $\pm 150$ psi

#### **TABLE 4. SENSOR PRESSURE TYPES**

| PRESSURE TYPE | DESCRIPTION  |
|---------------|--|
| Absolute      | Output is proportional to the difference between applied pressure and a built-in vacuum reference.     |
| Gage          | Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure.  |
| Differential  | Output is proportional to the difference between the pressures applied to each port (Port 1 - Port 2). |

#### **Notes**

- 1. Sensors are either 3.3 Vdc or 5.0 Vdc based on the catalog listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of 0°C to 50°C. Operation in Sleep Mode may affect temperature output error depending on duty cycle.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

- 1. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range mits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum
- 2. Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range.
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 3. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 4. Common mode pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 5. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 6. Total Error Band after Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage

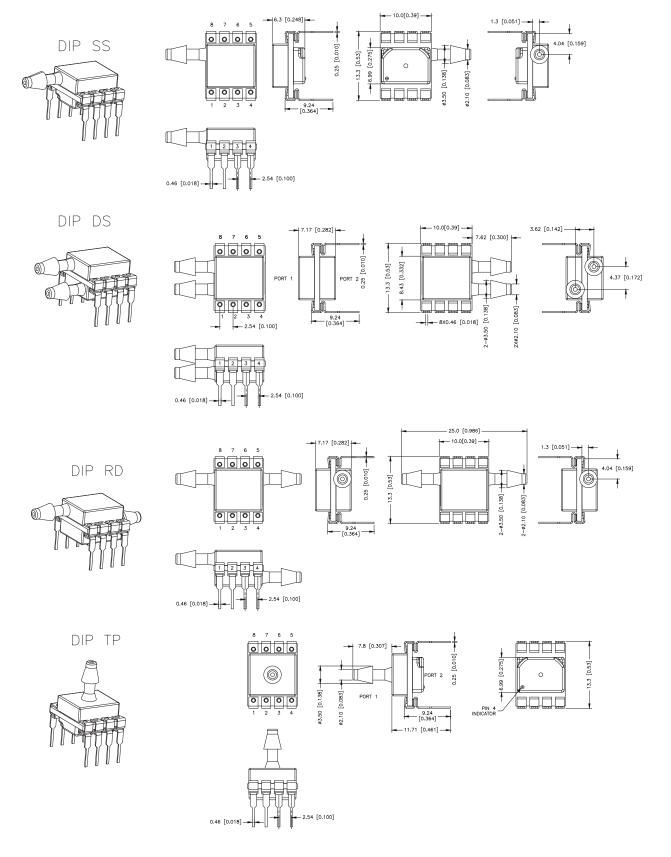

for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.

#### **DESCRIPTION**

SAABPH High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SAABPH Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50Hz.

SAABPH Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 3.3 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SAABPH Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### **Notes**

- 1. Sensors are 3.3 Vdc based on the specification listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of -10°C to 60°C.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

#### DESCRIPTION

SAABPC High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SAABPC Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at appro ximately 1 kHz.

SAABPC Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SAABPC Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

#### **Notes**

- 1. Sensors are either 3.3 Vdc or 5.0 Vdc based on the catalog listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of 0°C to 50°C. Operation in Sleep Mode may affect temperature output error depending on duty cycle.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range. (See Figure 1.)
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

### PRESSURE MODEL SA55

Anesthesia machines Spirometers Nebulizers Hospital room air pressure

- Variable Air Volume control
- Static duct pressure
- HVAC transmitters
- Clogged HVAC filter detection

#### DESCRIPTION

SA55 High Accuracy Silicon Ceramic sensor is apiezoresistive silicon pressure sensor,offerin g an analog/digital output for reading pressure over the specified full-scale pressure span and temperature range. SA55 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperatue effects, and non-linearity using an onboard Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 1 kHz.

SA55 Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA55 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

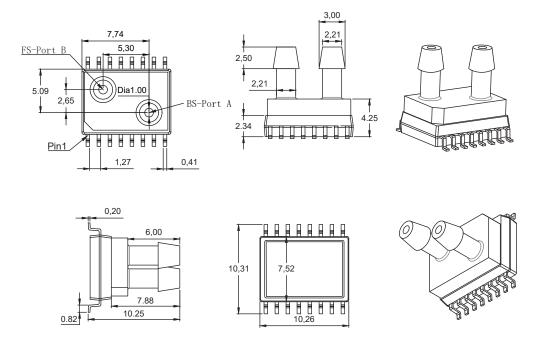

#### **FEATURES**

- Leak proof package:SA55 series pressure sensor is designed with leak proof package with side port and DIP. Basis substrate is optional with ceramic or FR4 PCB. Pressure port is optional with either ceramic or PPS material.
- Small size:10.3mm\*10.3mm compact package.
- Energy efficient: Extremely low power consumption: Supply voltage is 3.3 or 5Volts
- · RoHS compliant.
- Absolute, Differential and Gage pressure type.
- Wide variety of pressure ranges: Low pressure from ±1 mbar to±75 mbar, medium pressure from 1psi to 30psi, provide support for many unique applications.
- The 1/8" barbed pressure ports mate securely with 3/32" ID tubing.
- Customer orientation:Accuracy, Total error band and compensated temperature can be customized.
- Provides the sensor's true accuracy over a compensated range of -10 °C to 60 °C.
- Industry-leading long-term stability: Even after long-term use and thermal extremes, these sensors perform substantially better relative to stability than any other pressure sensor available in the industry today.
- Industry-leading accuracy: Extremely tight accuracy of ±0.25 %FSS BFSL (Full Scale Span Best Fit Straight Line)
- Industry-leading Total Error Band (TEB): Sensorall International specifies TEB—the most comprehensive, clear, and meaningful measurement—that provides the sensor's true accuracy over a compensated range of -10 °C to 60 °C.
- I2C- or SPI-compatible 14-bit digital output (min. 12-bit sensor resolution) accelerates performance through reduced conversion requirements and the convenience of direct interface to microprocessors or microcontrollers;
- Digital output types can offer 10%~90% output or 5%~95% output for optional.

#### **Notes**

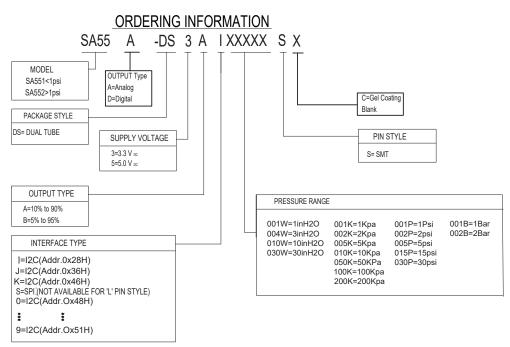

- 1.Maximum ratings are the extreme limits the device can withstand without damage to the product. Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.
- 2. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 3. The compensated temperature range is the temperature range over which the sensor will produce an output proportional to pressure within the specified performance limits.
- 4.The operating temperature range is the temperature range over which the sensor will produce an output proportional to pressure but may not remain within the specified performance limits.
- 5.Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25 °C Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.
- 6.Orientation sensitivity: The maximum change in offset of the sensor due to a change in position or orientation relative to Earth's gravitational field.
- 7.Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8.Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- 9.Life may vary depending on specific application in which sensor is utilized.
- 10. Contact Sensorall International Sales and Service for detailed material information.
- 11.Total Error Band After Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span.
- 12.Working Pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range limits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until pressure is returned to within the operating pressure range. Tested to 1 million cycles, min.
- 13.Overpressure: The absolute maximum rating for pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range. Tested to 10.000 cycles, minimum.
- 14.Burst Pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after exposure to any pressure beyond the burst pressure.
- 15.Common Mode Pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance. Customized design please contact Sensoral

# PRESSURE MODEL SA54

Anesthesia machines Spirometers Nebulizers Hospital room air pressure

- Variable Air Volume control
- Static duct pressure
- HVAC transmitters
- Clogged HVAC filter detection

SA54 High Accuracy leadframe sensor is a piezoresistive silicon pressure sensor, offering an 24bits digital output for reading pressure over the specified full scale pressure span and temperature range. SA54 Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an onboard Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50 Hz. SA54 Series is calibrated over the temperature range of 0 °C to 50 °C. The sensor is characterized for operation from a single power supply from 1.68 to 3.6 Vdc.

These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA54 Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

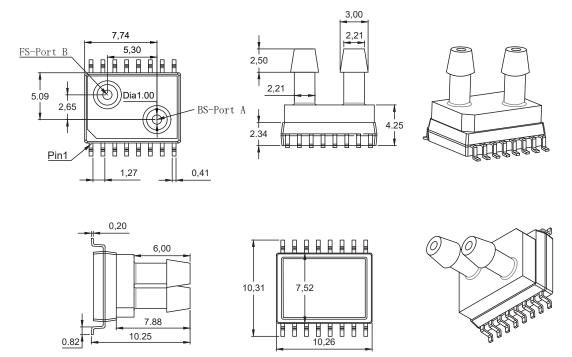

#### **FEATURES**

- Energy efficient: Extremely low power consumption: Supply voltage is from 1.68 to 3.6 Volts
- · RoHS compliant.
- · Absolute, Differential and Gage pressure type.
- Wide variety of pressure ranges: Low pressure from ±1 mbar to±75 mbar, medium pressure from 1psi to 30psi, provide support for many unique applications.
- The 1/8" barbed pressure ports mate securely with 3/32" ID tubing.
- Customer orientation: Accuracy, Total error band and compensated temperature can be customized.
- Provides the sensor's true accuracy over a compensated range of 0 °C to 50 °C.
- Industry-leading long-term stability: Even after long-term use and thermal extremes, these sensors perform substantially better relative to stability than any other pressure sensor available in the industry today.
- Industry-leading accuracy: Extremely tight accuracy of ±0.25 %FSS BFSL (Full Scale Span Best Fit Straight Line)
- Industry-leading Total Error Band (TEB): Sensorall International specifies TEB—the most comprehensive, clear, and meaningful measurement—that provides the sensor's true accuracy over a compensated range of 0 °C to 50 °C.
- I2C compatible 24-bit digital output (min. 18-bit sensor resolution) accelerates performance through reduced conversion requirements and the convenience of direct interface to microprocessors or microcontrollers;
- Digital output types can offer 10%~90% output or 5%~95% output for optional.

#### **Notes**

- 1.Maximum ratings are the extreme limits the device can withstand without damage to the product. Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.
- 2.The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 3.The compensated temperature range is the temperature range over which the sensor will produce an output proportional to pressure within the specified performance limits.
- 4.The operating temperature range is the temperature range over which the sensor will produce an output proportional to pressure but may not remain within the specified performance limits.
- 5.Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25 °C Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.
- 6.Orientation sensitivity: The maximum change in offset of the sensor due to a change in position or orientation relative to Earth's gravitational field.
- 7.Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8.Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- 9.Life may vary depending on specific application in which sensor is utilized.
- 10. Contact Sensorall International Sales and Service for detailed material information.
- 11.Total Error Band After Auto-Zero: The maximum deviation from the ideal transfer function over the entire compensated pressure range at a constant temperature and supply voltage for a minimum of 24 hours after an auto-zero operation. Includes all errors due to full scale span, pressure non-linearity, pressure hysteresis, and thermal effect on span
- 12. Working Pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range limits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until pressure is returned to within the operating pressure range. Tested to 1 million cycles, min.
- 13.Overpressure: The absolute maximum rating for pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range. Tested to 10,000 cycles, minimum.
- 14.Burst Pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after exposure to any pressure beyond the burst pressure.
- 15.Common Mode Pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.
- 16. Customized design please contact Sensorall International sales.

SA57 Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of either 3.3 Vdc or 5.0 Vdc. These sensors measure differential and gage pressures. Differential versions allow application of pressure to either side of the sensing diaphragm. Gage versions are referenced to atmospheric pressure and provide an output proportional to pressure variations from atmosphere. SA57 Series sensors are intended for use with noncorrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

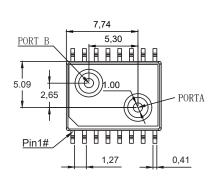

#### **FEATURES**

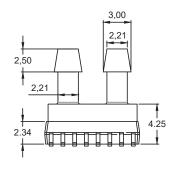

- · Leak proof package:SA57 series pressure sensor is designed with lead frame package with SO16 pin.
- Small size:10.3mm\*10.3mm compact package.
- Energy efficient: Extremely low power consumption: Supply voltage is 3.3 or 5Volts
- RoHS compliant.
- Absolute, Differential and Gage pressure type.
- Wide variety of pressure ranges: Low pressure from ±1 mbar to±75 mbar, medium pressure from 1psi to 30psi, provide support for many unique applications.
- The 1/8" barbed pressure ports mate securely with 3/32" ID tubing.
- Customer orientation: Accuracy, Total error band and compensated temperature can be customized.
- Provides the sensor's true accuracy over a compensated range of -20 °C to 85 °C.
- Industry-leading long-term stability: Even after long-term use and thermal extremes, these sensors perform substantially better relative to stability than any other pressure sensor available in the industry today.
- Industry-leading accuracy: Extremely tight accuracy of ±0.25 %FSS BFSL (Full Scale Span Best Fit Straight Line)
- Industry-leading Total Error Band (TEB): Sensorall International specifies TEB—the most comprehensive, clear, and meaningful measurement—that provides the sensor's true accuracy over a compensated range of -10 °C to 60 °C.
- I2C- or SPI-compatible 16-bit digital output (min. 12-bit sensor resolution) accelerates performance through reduced conversion requirements and the convenience of direct interface to microprocessors or microcontrollers;
- Digital output types can offer 10%~90% output or 5%~95% output for optional.

#### **Notes**

- 1. Sensors are either 3.3 Vdc or 5.0 Vdc based on the catalog listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of 0°C to 50°C.
  Operation in Sleep Mode may affect temperature output error depending on duty cycle.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

Disposble Blood Pressure Sensor AAMI Specification Low Cost Multiple Configurations

- Disposable Blood Pressure
- Kidney Dialysis Machines
- Medical Instrumentation

#### **FEATURES**

- Low Cost Disposable Design
- Solid State Piezoresistive Sensor
- Top Side Pressure Entry
- Compatible with Automated Assembly Equipment
- Integral Dielectric Gel Barrier
- Fully Tested and Compensated

#### **DESCRIPTION**

The Model SA1620 is a fully piezoresistive silicon pressure sensor for use in invasive blood pressure monitoring. The sensor is designed to be used with automated assembly equipment and can be dropped directly into a customer's disposable blood pressure housing. The sensor is designed to meet the requirements as described in the Association for the Advancement of Medical Instrumentation (AAMI) specification for Blood Pressure Transducers.

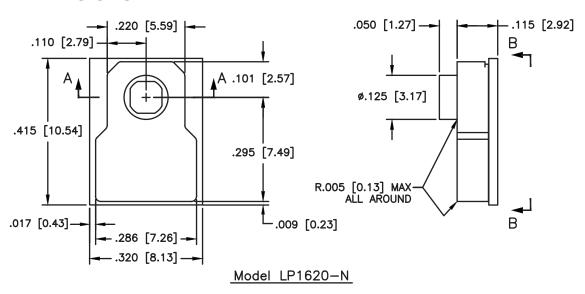

The pressure sensor consists of a pressure sensing element mounted on a ceramic substrate. Thick-film resistors on the ceramic substrate are laser-trimmed for compensation and calibration.

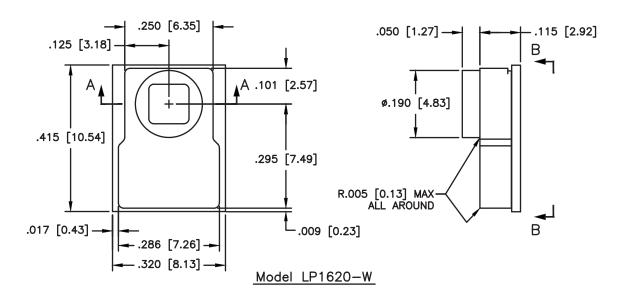

A plastic cap is attached to the ceramic substrate to provide an easy method of attachment to the customers assembly and protection for the sensing element. A dielectric gel is placed over the sensor to provide electrical and fluid isolation.

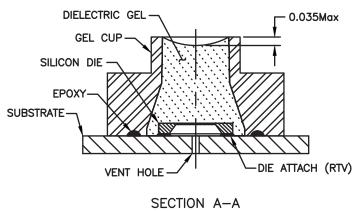

The Model SA1620 pressure sensors are batch manufactured in a 10 x 5 element array on a ceramic substrate (50 units per substrate). The products are shipped in anti-static shipping containers. Performance characteristics and packaging can be easily tailored on a special order basis to meet the requirements of specific customers.

#### **Notes**

- 1. Output of sensor with no pressure applied and a 150k $\!\Omega$  resistor shorted across +VIN to +OUT.
- 2. For input impedance of 350 Ohms ± 5% select pad configuration 1.

  3. Over an 8 hour time period and after warm-up.

  4. Over operating temperature range (+10°C to +40°C).

- 5. One discharge per minute performed by customer.
- Sterilization performed by customer.
   Defined as common mode symmetry between signal output and either excitation terminal.

  8. Best fit straight line.

#### **DESCRIPTION**

The Model SA1620HD is a fully piezoresistive silicon pressure sensor for use in invasive blood pressure monitoring. The sensor is designed to be used with automated assembly equipment and can be dropped directly into a customer's disposable blood pressure housing. The sensor is designed to meet the requirements as described in the Association for the Advancement of Medical Instrumentation (AAMI) specification for Blood Pressure Transducers.

SA1620HD High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor, offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SA1620HD Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50Hz.

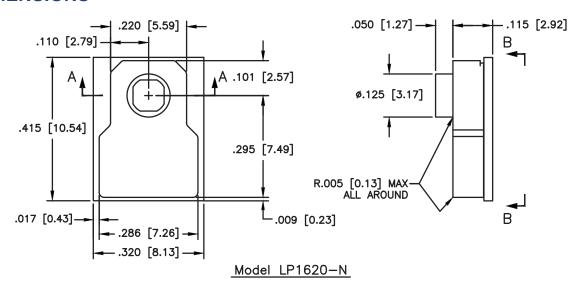

SA1620HD Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 3.3 Vdc . SA1620HD Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

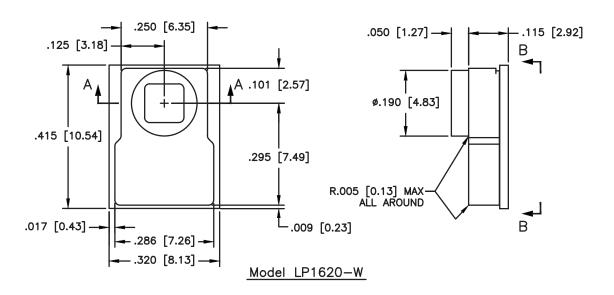

A plastic cap is attached to the ceramic substrate to provide an easy method of attachment to the customers assembly and protection for the sensing element. A dielectric gel is placed over the sensor to provide electrical and fluid isolation.

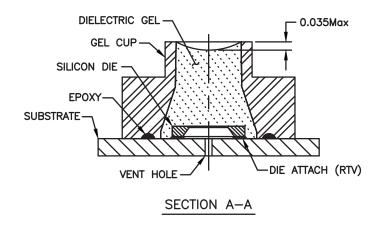

The Model SA1620HD pressure sensors are batch manufactured in a 10 x 5 element array on a ceramic substrate (50 units per substrate). The products are shipped in anti-static shipping containers. Performance characteristics and packaging can be easily tailored on a special order basis to meet the requirements of specific customers.

## **MODEL SA1620HD**

#### **Notes**

- 1. Sensors are 3.3 Vdc based on the specification listing selected.
- 2. Ratiometricity of the sensor (the ability of the device output to scale to the supply voltage) is achieved within the specified rating voltage.
- 3. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 4. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 5. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
- 6. Temperature output option: Typical temperature output error over the compensated temperature range of -10°C to 60°C.
- 7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the
  pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability

#### **FEATURES**

- I2C or SPI selectable
- ±0.1% Pressure Non-linearity
- -10°C To +60°C Compensated Temperature Range
- 0.5% Interchangeable
- Solid State Reliability
- Low Power

#### **DESCRIPTION**

The Model SA5660HD is a fully piezoresistive silicon pressure sensor with polysulfone plastic housing for use in invasive blood pressure or other disposable pressure monitoring. The sensor is designed to meet the requirements as described in the Association for the Advancement of Medical Instrumentation (AAMI) specification for Blood Pressure Transducers.

SA5660HD High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor, offering an analog/digital output for reading pressure over the specified full scale pressure span and temperature range. SA5660HD Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50Hz.

SA5660HD Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 3.3 Vdc . SA5660HD Series sensors are intended for use with non-corrosive, non-ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

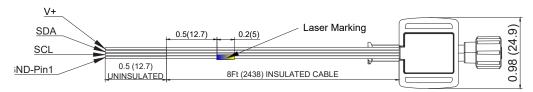

A dielectric gel is placed over the sensor to provide electrical and fluid isolation.

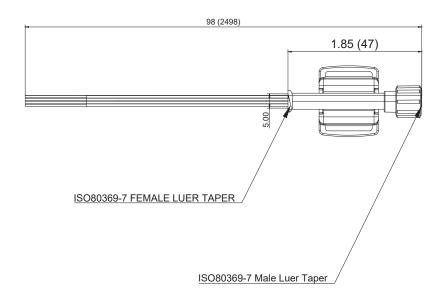

The products are shipped in anti-static shipping containers. Performance characteristics and packaging can be easily tailored on a special order basis to meet the requirements of specific customers.

316 SS Pressure Sensor High Performance, 19 mm 0-100 mV Output Absolute and Gage Constant Current

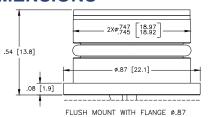

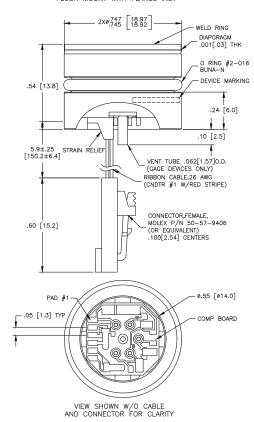

#### **DESCRIPTION**

The Model SA154C is a 19 mm small profile, media compatible piezoresistive silicon pressure sensor packaged in a 316L stainless steel housing. The Model SA154C is designed for O-ring mounting. The sensing package utilizes silicon oil to transfer pressure from the 316L stainless steel diaphragm to the sensing element.

#### **Notes**

- 1. For amplified output circuits, 3.012V ±1% interchangeability with gain set resistor. See application schematic.
- 2. Measured at vacuum for absolute (A), ambient for gage (G).
- Best fit straight line.
- 4. Over the compensated temperature range with respect to 25°C.
- $5. \ Guarantees \ output/input \ ratiometricity.$
- 6. Load resistance to reduce measurement errors due to output loading.
- $\label{eq:case and sensing element.} \enskip \textbf{and sensing element}.$
- 8. The maximum pressure that can be applied to a transducer without rupture of either the sensing element or transducer.
- 9. Maximum temperature range for product with standard cable and connector is -20°C to +105°C.
- 10. Standard gage units are not recommended for vacuum applications. For vacuum applications below 1/2 atmosphere, consult factory.
- 11. Device Marking: Each part shall be identified with Model Number, Pressure Range, Type, Lot Number, Serial Number and Date Code.
- 12. Shipping/Packaging requirements:
- The stainless steel diaphragm is protected by a plastic CAP. Each unit will be packaged individually in a plastic vial with anti-static foam.
- 13. Direct mechanical Contact with diaphragm is prohibited. Diaphragm surface must remain free of defects (scratches, punctures, dents, fingerprints, etc) for device to operate properly. Caution is advised when handling parts with exposed diaphragms. Use protective cap whenever devices are not in use.

# **MODEL SA154CV**

316 SS Pressure Sensor High Performance, 19 mm 0-100 mV Output Absolute and Gage Constant Voltage

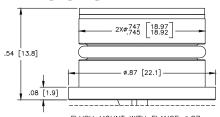

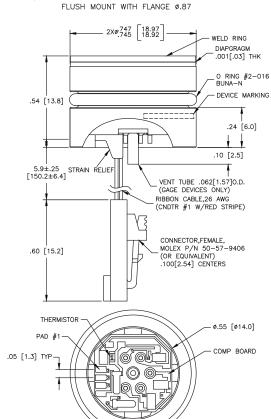

#### **DESCRIPTION**

The Model SA154CV is a 19 mm small profile, media compatible,piezoresistive silicon pressure sensor packaged in a 316L stainless steel housing. The Model SA154CV is designed for O-ring mounting. The sensing package utilizes silicon oil to transfer pressure from the 316L stainless steel diaphragm to the sensing element.

#### **Notes**

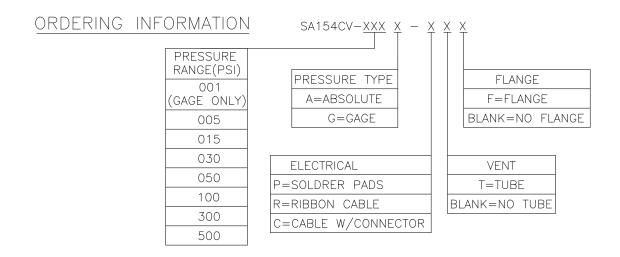

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A), AMBIENT FOR GAGE (G).
- 2. BEST FIT STRAIGHT LINE.
- 3. OVER THE COMPENSATED TEMPERATURE RANGE WITH RESPECT TO 25°C.
- 4. GUARANTEES OUTPUT/INPUT RATIOMETRICITY.
- 5. LOAD RESISTANCE TO REDUCE MEASUREMENT ERRORS DUE TO OUTPUT LOADING.
- 6. BETWEEN CASE AND SENSING ELEMENT.
- 7. THE MAXIMUM PRESSURE THAT CAN BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER
- 8. MAXIMUM TEMPERATURE RANGE FOR PRODUCT WITH STANDARD CABLE AND CONNECTOR IS -20 °C TO +105 °C.
- 9. STANDARD GAGE UNITS ARE NOT RECOMMENDED FOR VACUUM APPLICATIONS.
- FOR VACUUM APPLICATIONS BELOW 1/2 ATMOSPHERE, CONSULT FACTORY.
- SENSOR PERFORMANCE. DEVICES WITH LOWER PRESSURE RANGES HAVE GREATER SUSCEPTIBILITY TO HEAT GENERATED DURING THE WELD PROCESS.

  10. DEVICE MARKING:
  - EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (GAGE OR ABSOLUTE), LOT NUMBER, SERIAL NUMBER AND DATE CODE.
- 11. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 12. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM. USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

#### ORDERING INFORMATION

# **MODEL SA154BSD**

#### APPLICATION SCHEMATIC

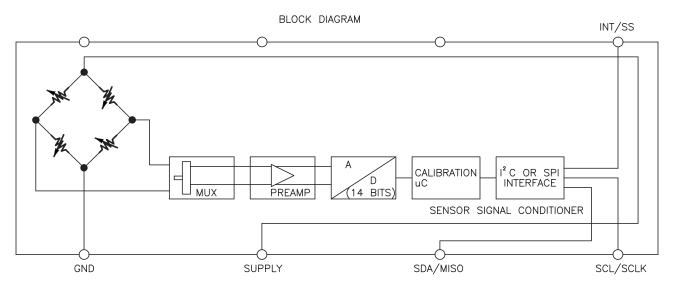

#### Notes

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A), AMBIENT FOR GAGE (G). OUTPUT IS NOT RATIONMETRIC TO SUPPLY VOLTAGE.
- 2. ACCURACY : COMBINED LINEARITY, HYSTERESIS AND REPEATILITY.
- 2. ACCOMMON COMMON COMMON COMMON REPORT TO SHEET SHOULD SHEET SHOULD SHEET SHE
- 4. THE DEVIATION FROM A BEST FIT FIT STRAIGHT LINE(BFSL) FITTED TO THE OUTPUT MEASURED OVER THE COMPENSATED TEMPERAURE RAGE. FOR ERRORS BEYOND THE COMPENSATED TEMPERATURE RANGE, SEE FIG 1 OF SHEET 8.
- 5. BETWEEN CASE AND SENSING ELEMENT.
- 6. 2X OR 400PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT CHANGING THE TRANSDUCER'S PERFORMANCE OF ACCURACY.
- 7. 3X OR 600PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER.
- 8. MAXIMUM TEMPERATURE RANGE FOR PRODUCT WITH STANDARD CABLE AND CONNECTOR IS -20°C TO +105°C.
- 9. START TIME TO DATA RADY IS THE TIME TO GET VALID DATA AFTER POR (POWER ON RESET). THE TIME TO GET SUBSEQUENT VALID DATA IS THEN SPECIFIED BY THE RESPONSE TIME SPECIFICATION.
- 10. DEVICE MARKING: EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (GAGE OR ABSOLUTE), LOT NUMBER, SERIAL NUMBER AND DATE CODE.
- 11. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 12. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM. USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

#### DESCRIPTION

SA85U is a micromachined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted on a TO style header, which is resistance welded to a 316 stainless steel package. A 316 stainless steel convoluted isolation diaphraam is welded to the package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil column to couple the piezoresistive sensor to the isolation diaphragm. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT, 1/4 BSP as well as custom process fittings. Electrical options include cable and connector.

#### **DESCRIPTION**

SA85C is a micromachined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted on a TO style header, which is resistance welded to a 316 stainless steel package. A 316 stainless steel convoluted isolation diaphragm is welded to the package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil column to couple the piezoresistive sensor to the isolation diaphragm. A thick film ceramic compensation board with laser-trimmed resistors, and an additional gain set resistor to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT, 1/4 BSP as well as custom process fittings. Electrical options include cable and connector.

#### DESCRIPTION

SA85BSD is a micromachined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted on a TO style header, which is resistance welded to a 316 stainless steel package. A 316 stainless steel convoluted isolation diaphraam is welded to the package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil column to couple the piezoresistive sensor to the isolation diaphragm. An ASIC compensation board to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT, 1/4 BSP as well as custom process fittings. Electrical options include cable and connector.

## 316L SS Pressure Sensor

## **MODEL SA85BSD**

#### ORDERING INFORMATION

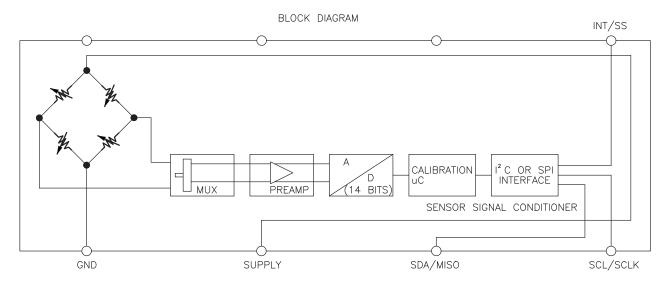

#### **Notes**

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A), AMBIENT FOR GAGE (G). OUTPUT IS NOT RATIONMETRIC TO SUPPLY VOLTAGE.
- 2. ACCURACY: COMBINED LINEARITY, HYSTERESIS AND REPEATILITY.
- 3. TOTAL BAND: INCLUDES CALIBRATION ERRORS AND TEMPERATURE EFFECTS OVER THE COMPENSATED RANGE. SEE FIG 2 OF SHEET 10
- 4. THE DEVIATION FROM A BEST FIT FIT STRAIGHT LINE(BFSL) FITTED TO THE OUTPUT MEASURED OVER THE COMPENSATED TEMPERAURE RAGE. FOR ERRORS BEYOND THE COMPENSATED TEMPERATURE RANGE, SEE FIG 1 OF SHEET 10.
- 5. BETWEEN CASE AND SENSING ELEMENT.
- 6. 2X OR 400PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT CHANGING THE TRANSDUCER'S PERFORMANCE OF ACCURACY.
- 7. 3X OR 600PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER.
- 8. MAXIMUM TEMPERATURE RANGE FOR PRODUCT WITH STANDARD CABLE AND CONNECTOR IS -20°C TO +105°C.
- 9. START TIME TO DATA RADY IS THE TIME TO GET VALID DATA AFTER POR (POWER ON RESET). THE TIME TO GET SUBSEQUENT VALID DATA IS THEN SPECIFIED BY THE RESPONSE TIME SPECIFICATION.
- 10. SHARP EDGE STRONGLY RECOMMENDED FOR WELDING APPLICATION. OPTIUM WELD PARAMETERS WILL REDUCE THE EFFECT OF WELD HEAT ON SENSOR PERFORMANCE. DEVICES WITH LOWER PRESSURE RANGES HAVE GREATER SUSCEPTIBILITY TO HEAT GENERATED DURING THE WELD PROCESS.
- 11. DEVICE MARKING:
  - EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (GAGE OR ABSOLUTE),
  - LOT NUMBER, SERIAL NUMBER AND DATE CODE.
- 12. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 13. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM. USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

## **MODEL SA85ESBSD**

#### ORDERING INFORMATION

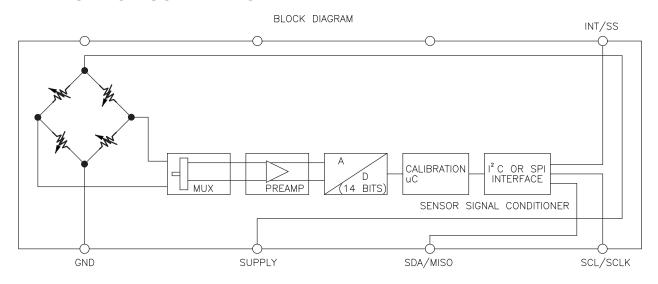

#### **Notes**

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A), AMBIENT FOR SEALED GAGE (S) AND GAGE (G), OUTPUT IS NOT RATIONMETRIC TO SUPPLY VOLTAGE.
- 2. ACCURACY: COMBINED LINEARITY, HYSTERESIS AND REPEATILITY.
- 3. TOTAL BAND: INCLUDES CALIBRATION ERRORS AND TEMPERATURE EFFECTS OVER THE COMPENSATED RANGE. SEE FIG 2 OF SHEET 17.
- 4. THE DEVIATION FROM A BEST FIT FIT STRAIGHT LINE(BFSL) FITTED TO THE OUTPUT MEASURED OVER THE COMPENSATED TEMPERAURE RAGE. FOR ERRORS BEYOND THE COMPENSATED TEMPERATURE RANGE, SEE FIG 1 OF SHEET 17.
- 5. BETWEEN CASE AND SENSING ELEMENT.
- 6. 2X OR 400PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT CHANGING THE TRANSDUCER'S PERFORMANCE OF ACCURACY.
- 7. 3X OR 600PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER.
- 8. MAXIMUM TEMPERATURE RANGE FOR PRODUCT WITH STANDARD CABLE AND CONNECTOR IS -20°C TO +105°C.
- 9. START TIME TO DATA RADY IS THE TIME TO GET VALID DATA AFTER POR (POWER ON RESET). THE TIME TO GET SUBSEQUENT VALID DATA IS THEN SPECIFIED BY THE RESPONSE TIME SPECIFICATION.
- 10. DEVICE MARKING:
  - EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (SEALED GAGE OR ABSOLUTE), LOT NUMBER, SERIAL NUMBER AND DATE CODE.
- 11. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 12. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM.

  USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

# **MODEL SA85F**

316L SS Pressure Sensor Flush Mount 0-150 mV Output Absolute and Gage Constant Current

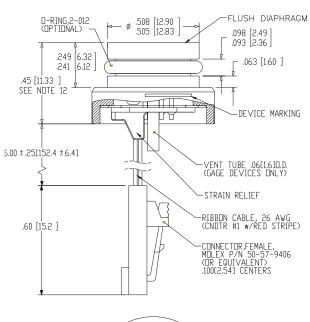

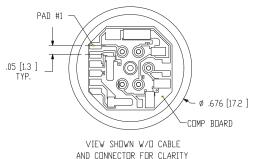

#### **DESCRIPTION**

SA85F is a micromachined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted on a TO style header, which is resistance welded to a 316 stainless steel package. A 316 stainless steel convoluted isolation diaphragm is welded to the package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil column to couple the piezoresistive sensor to the isolation diaphragm. An ASIC compensation board to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT, 1/4 BSP as well as custom process fittings. Electrical options include cable and connector.

#### **Notes**

- 1. For amplified output circuits, 3.012V  $\pm 1\%$  interchangeability with gain set resistor. See application schematic.
- 2. Measured at vacuum for absolute (A), ambient for gage (G) and compound (C).
- 3. Best fit straight line.
- 4. Over the compensated temperature range with respect to 25°C.
- 5. Guarantees output/input ratiometricity.
- 6. Load resistance to reduce measurement errors due to output loading.
- 7. Between case and sensing element.
- 8. The maximum pressure that can be applied to a transducer without rupture of either the sensing element or transducer.
- 9. Maximum temperature range for product with standard cable and connector is -20  $^{\circ}$ C to +105  $^{\circ}$ C.
- 10. Standard gage units are not recommended for vacuum applications. For vacuum applications below 1/2 atmosphere, consult factory.

  11. Device Marking:
- Each part shall be identified with Model Number, Pressure Range, Type, Lot Number, Serial Number and Date Code. 12. Shipping/Packaging requirements:
- The stainless steel diaphragm is protected by a plastic CAP. Each unit will be packaged individually in a plastic vial with anti-static foam.
- 13. Direct mechanical Contact with diaphragm is prohibited. Diaphragm surface must remain free of defects (scratches, punctures, dents, fingerprints, etc) for device to operate properly. Caution is advised when handling parts with exposed diaphragms. Use protective cap whenever devices are not in use.

316L SS Pressure Sensor High Performance, Small Profile 0-100 mV Output Absolute and Gage Constant Voltage

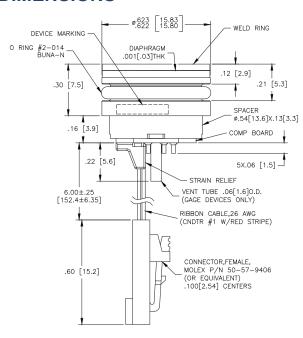

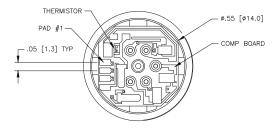

#### DESCRIPTION

SA86CV is a micromachined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted on a TO style header, which is resistance welded to a 316 stainless steel package. A 316 stainless steel convoluted isolation diaphragm is welded to the package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filledlled pressure housing utilizes the oil column to couple the piezoresistive sensor to the isolation diaphragm. A thick film ceramic compensation board with lasertrimmed resistors, and an additional gain set resistor to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT, 1/4 BSP as well as custom process fittings. Electrical options include cable and connector.

# **MODEL SA86CV**

#### APPLICATION SCHEMATIC

EQUIVALENT SCHEMATIC

RECOMMENDED MOUNTING DIMENSIONS

#### **Notes**

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A), AMBIENT FOR GAGE (G).
- 2. BEST FIT STRAIGHT LINE.
- 3. OVER THE COMPENSATED TEMPERATURE RANGE WITH RESPECT TO 25°C.
- 4. GUARANTEES OUTPUT/INPUT RATIOMETRICITY.
- 5. LOAD RESISTANCE TO REDUCE MEASUREMENT ERRORS DUE TO OUTPUT LOADING.
- 6. BETWEEN CASE AND SENSING ELEMENT.
- 7. THE MAXIMUM PRESSURE THAT CAN BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER
- 8. MAXIMUM TEMPERATURE RANGE FOR PRODUCT WITH STANDARD CABLE AND CONNECTOR IS -20°C TO +105°C.
- 9. STANDARD GAGE UNITS ARE NOT RECOMMENDED FOR VACUUM APPLICATIONS.
- FOR VACUUM APPLICATIONS BELOW 1/2 ATMOSPHERE, CONSULT FACTORY.
- SENSOR PERFORMANCE. DEVICES WITH LOWER PRESSURE RANGES HAVE GREATER SUSCEPTIBILITY TO HEAT GENERATED DURING THE WELD PROCESS.
- 10. DEVICE MARKING:
- EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (GAGE OR ABSOLUTE),
- LOT NUMBER, SERIAL NUMBER AND DATE CODE.
- 11. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 12. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM. USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

## **MODEL SA86BSD**

316L SS Pressure Sensor High Performance, Small Profile 14bits I2C/SPI Output Absolute and Gage Low Pressure

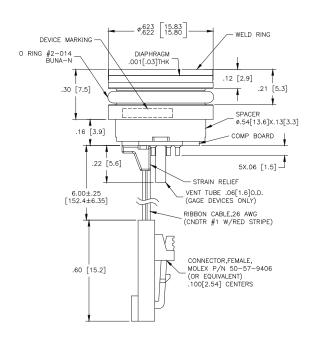

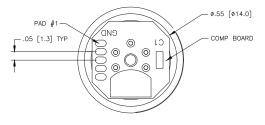

#### **DESCRIPTION**

SA86BSD is a micromachined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted on a TO style header, which is resistance welded to a 316 stainless steel package. A 316 stainless steel convoluted isolation diaphragm is welded to the package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filledlled pressure housing utilizes the oil column to couple the piezoresistive sensor to the isolation diaphragm. An ASIC compensation board to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT, 1/4 BSP as well as custom process fittings. Electrical options include cable and connector.

#### Notes

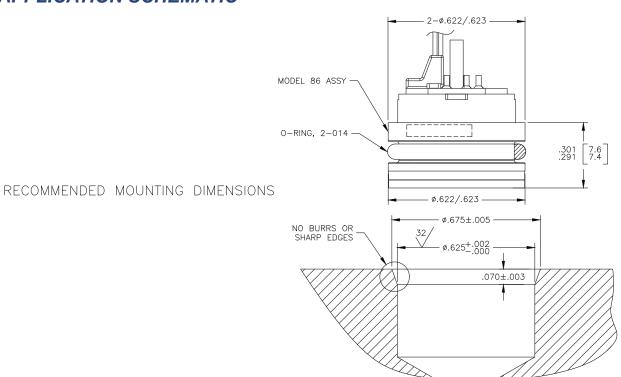

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A), AMBIENT FOR GAGE (G). OUTPUT IS NOT RATIONMETRIC TO SUPPLY VOLTAGE.
- 2. ACCURACY : COMBINED LINEARITY, HYSTERESIS AND REPEATILITY.
- 3. TOTAL BAND: INCLUDES CALIBRATION ERRORS AND TEMPERATURE EFFECTS OVER THE COMPENSATED RANGE. SEE FIG 2 OF SHEET 8.
- 4. THE DEVIATION FROM A BEST FIT FIT STRAIGHT LINE(BFSL) FITTED TO THE OUTPUT MEASURED OVER THE COMPENSATED TEMPERAURE RAGE. FOR ERRORS BEYOND THE COMPENSATED TEMPERATURE RANGE, SEE FIG 1 OF SHEET 8.
- 5. BETWEEN CASE AND SENSING ELEMENT.
- 6. 2X OR 400PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT CHANGING THE TRANSDUCER'S PERFORMANCE OF ACCURACY.
- 7. 3X OR 600PSI, WHICHEVER IS LESS, THE MAX PRESSURE THAT CAB BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER.
- $8.\ MAXIMUM\ TEMPERATURE\ RANGE\ FOR\ PRODUCT\ WITH\ STANDARD\ CABLE\ AND\ CONNECTOR\ IS\ -20^{\circ}C\ TO\ +105^{\circ}C.$
- 9. START TIME TO DATA RADY IS THE TIME TO GET VALID DATA AFTER POR (POWER ON RESET). THE TIME TO GET SUBSEQUENT VALID DATA IS THEN SPECIFIED BY THE RESPONSE TIME SPECIFICATION.
- 10. DEVICE MARKING: EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (GAGE OR ABSOLUTE), LOT NUMBER, SERIAL NUMBER AND DATE CODE.
- 11. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 12. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM. USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

- Refrigeration/Compressors
- Pressure Transmitters

### **DESCRIPTION**

SA87F is a micro machined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted in a 316 stainless steel package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil column to couple the piezoresisteve sensor to the isolation diaphragm. A thickfilm ceramic compensation board with laser trimmed resistors, and additional gain set resistor to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT as well as custom process fittings. Electrical options include cable and connector.

### ORDERING INFORMATION

### **MODEL SA87N**

#### APPLICATION SCHEMATIC

#### **Notes**

- 1. Measured at vacuum for absolute (A) and ambient for sealed gage (S).
- for amplified output circuits, 3.012v ±1% interchangeability with gain set resistor.
- 2. Best fit straight line
- 3. Over temperature range -20°C to +85°C, with respect to +25°C.
- 4. Load resistance to reduce measurement errors due to output loading.
- 5. Between case and sensing element.6. Pressure overload 3x or 15,000 psi, whichever is less.
- The maximum pressure that can be applied without changing the transducer's performance or accuracy.
- 7. Pressure burst 4x or 15,000 psi, whichever is less.
- The maximum pressure that can be applied to a transducer without rupture of either the sensing element or transducer. 8. Maximum temperature range for product with standard cable and connector is -20°C to +105°C.

- 9. Testing:
  All 3000 and 5000 psi parts are tested at 2500 psi and calculated to full scale pressure respective. 10. Marking:
- Parts are marked with model number, pressure range, type ("A" for absolute or "S" for sealed gage), Lot number, serial number and date code.
- Sharp edge strongly recomended for welding application. Optium weld parameters will reduce the effect of weld heat on sensor performance.
   Direct mechanical contact with diaphragm is prohibited. Diaphragm surface must remain free of defects (scratches, punctures, fingerprints, etc.) for device to operate properly. Caution is advised when handling parts with exposed diaphragms.
   Use protective cap whenever devices are not in use.

### **DESCRIPTION**

SA87FK is a micro machined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted in a 316 stainless steel package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil cooil filled to couple the piezoresisteve sensor to the isolation diaphragm. A thickfilm ceramic compensation board with laser trimmed resistors, and additional gain set resistor to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT as well as custom process fittings. Electrical options include cable and connector.

### ORDERING INFORMATION

# **MODEL SA89CV**

#### **APPLICATION SCHEMATIC**

EQUIVALENT SCHEMATIC

#### **Notes**

- 1. MEASURED AT VACUUM FOR ABSOLUTE (A) AND AMBIENT FOR SEALED GAGE (S).
- 2. BEST FIT STRAIGHT LINE
- 2. DESTITION THAT THE PROPERTY OF THE PROPERT
- 5. BETWEEN CASE AND SENSING ELEMENT.
- 6. 3X OR 20,000 PSI, WHICHEVER IS LESS.
  7. 4x OR 30,000 PSI, WHICHEVER IS LESS. THE MAXIMUM PRESSURE THAT CAN BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER.
- 8. MAXIMUM TEMPERATURE RANGE FOR PRODUCT WITH STANDARD CABLE AND CONNECTOR IS -20°C TO +105°C.
- 9. TESTING:
- ALL 3,000, 5,000 & 10,000 PSI PARTS ARE TESTED AT 2500 PSI AND CALCULATED TO FULL SCAEL PRESSURE RESPECTIVE.
- 10. MARKING:
- PARTS ARE MARKED WITH MODEL NUMBER,
- PRESSURE RANGE, TYPE("A" FOR ABSOLUTE OR "S" FOR SEALED GAGE), LOT
- NUMBER, SERIAL NUMBER AND DATE CODE.
- SHIPPED IN A PLASTIC CONTAINER WITH ANTI-STATIC FOAM.

# **MODEL SA89U**

316 SS Pressure Sensor High Performance, Small Profile mV Output Uncompensated Absolute and Sealed Gage

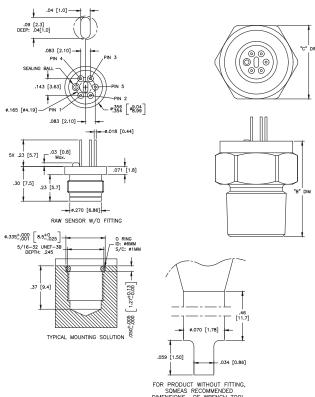

### **DESCRIPTION**

SA89U is a micro machined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted in a 316 stainless steel package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The ISO pressure housing utilizes the oil column to couple the piezoresisteve sensor to the isolation diaphragm. A thickfilm ceramic compensation board with laser trimmed resistors, and additional gain set resistor to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT as well as custom process fittings. Electrical options include cable and connector.

- Hydraulic Controls
- Process Control
- Robotics
- Oceanography
- Refrigeration/Compressors
- Pressure Transmitters

### **DIMENSIONS**

#### CONNECTIONS

| PAD/CNDTR | FUNCTION |

#### Notes

- 1. MEASURED AT AMBIENT TEMPERATURE.
- 2. BEST FIT STRAIGHT LINE.
- 3. MEASURED WITH BOTH -E PINS SHORTED TOGETHER.
- 4. OVER TEMPERATURE RANGE -20°C TO +70°C, WITH RESPECT TO +25°C.
- 5. BETWEEN CASE AND SENSING ELEMENT.
- 3X OR 20,000PSI, WHICHEVER IS LESS. THE MAXIMUM PRESSURE THAT CAN BE APPLIED WITHOUT CHANGING THE TRANSDUCERS PERFORMANCE OR ACCURACY.
- 7. 4X OR 30,000PSI, WHICHEVER IS LESS. THE MAXIMUM PRESSURE THAT CAN BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF FITHER THE

SENSING ELEMENT OR TRANSDUCER.

- 8. FOR DEVICES WITHOUT FITTINGS; TYPICAL RECEPTACLE 316 ST STL, TENSILE STRENGTH 75,000PSI MIN.
  9. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED. DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES
- FINGERPRINTS, ETC) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGMS. USE PROTECTIVE

CAP WHENEVER DEVICES ARE NOT IN USE.

- 10. TESTING: ALL 03K, 05K AND 10KPSI PARTS ARE TESTED AT 2500PSI AND CALCULATED TO FULL SCALE PRESSURE RESPECTIVELY.
- 11. MARKING: PARTS ARE MARKED WITH COMPANY NAME, MODEL NUMBER, PRESSURE RANGE, LOT NUMBER, SERIAL NUMBER, AND DATE
- 12. SHIPPING: THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A STATIC DISSIPATIVE CAP. EACH UNIT IS PACKAGED INDIVIDUALLY IN A PLASTIC

CONTAINER WITH ANTI-STATIC FOAM.

316 SS Pressure Sensor High Performance, Small Profile 24bits I2C/SPI Output Temperature Compensated Absolute and Sealed Gage

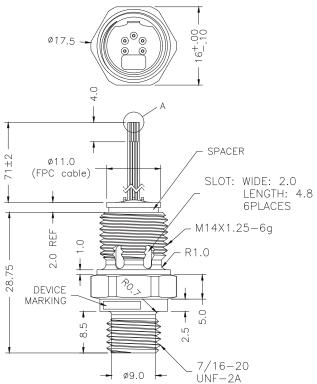

### **DESCRIPTION**

SA89BSD is a micro machined piezoresistive silicon pressure sensor. It is designed for OEM applications where compatibility with corrosive media must be maintained. The sensor chip is mounted in a 316 stainless steel package, sealing a small volume of silicon oil between the diaphragm and the sensor chip. The oil filled pressure housing utilizes the oil column to couple the piezoresisteve sensor to the isolation diaphragm. An ASICcompensation board to normalize pressure sensitivity are an integral part of the sensor package. A variety of threaded process fittings are available. Fittings include standards like 1/4 and 1/8 NPT as well as custom process fittings. Electrical options include cable and connector.

#### **Notes**

- 1. The sensor is not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.
- 2. Working pressure: The maximum pressure that may be applied to any port of the sensor in continuous use. This pressure may be outside the operating pressure range

limits (Pmin. to Pmax.) in which case the sensor may not provide a valid output until presssure is returned to within the operating pressure range. Tested to 1 million cycles minimum.

- 3. Over pressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure
- to higher pressures may cause permanent damage to the product. Unless otherwise specified this applies to all available pressure ports at any temperature with the operating temperature range.
- 4. Burst pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. Product should not be expected to function after
- exposure to any pressure beyond the burst pressure.
- 5. Operating temperature range: The temperature range over which the sensor will produce an output proportional to pressure.
- 6. Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pessure within the specified performance limits.
  7. Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pessure range. Includes all
- errors due to offset,
- full scale span, pressure non-linearity, pressure hysteresis, repeatability,thermal effect on offset, thermal effect on span, and thermal hysteresis.
- 8. Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range. (See Figure 1.)
- 9. Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis, and non-repeatability.

#### **Notes**

- 1. BEST FIT STRAIBHT LINE.
- 2. OVER THE COMPENSATED TEMPETATURE RANGE WITH RESPECT TO  $25^{\circ}\mathrm{C}.$
- 3. GUARANTEES OUTPUT/INPUT RATIONMETRICITY.
- 4. BETWEEN CASE AND SENSING ELEMENT.
- 5. THE MAXMIUM PRESSURE THAT CAN BE APPLIED TO A TRANSDUCER WITHOUT RUPTURE OF EITHER THE SENSING ELEMENT OR TRANSDUCER.
  6. DEVICE MARKING:

EACH PART SHALL BE IDENTIFIED WITH MODEL NUMBER, PRESSURE RANGE, TYPE (GAGE OR ABSOLUTE),

- LOT NUMBER. SERIAL NUMBER AND DATE CODE.
- 7. SHIPPING/PACKAGING REQUIREMENTS:
- THE STAINLESS STEEL DIAPHRAGM IS PROTECTED BY A PLASTIC CAP. EACH UNIT WILL BE PACKAGED INDIVIDUALLY IN A PLASTIC VIAL WITH ANTI-STATIC FOAM.
- 8. DIRECT MECHANICAL CONTACT WITH DIAPHRAGM IS PROHIBITED, DIAPHRAGM SURFACE MUST REMAIN FREE OF DEFECTS (SCRATCHES, PUNCTURES, DENTS, FINGERPRINTS, ECT) FOR DEVICE TO OPERATE PROPERLY. CAUTION IS ADVISED WHEN HANDLING PARTS WITH EXPOSED DIAPHRAGM. USE PROTECTIVE CAP WHENEVER DEVICES ARE NOT IN USE.

## **MODEL SA89VI**

Disposible Pressure Sensor 0-10Vdc or 4-20mA Output Gage and Absolute Temperature Compensated

- Invasive Blood Pressure
- Hemodialysis
- Biochemical Analyzer
- Urodynamics
- Intrauterine Pressure
- Intracranial Pressure

### **FEATURES**

- 0-10V or 4-20mA selectable
- ±0.1% Pressure Non-linearity
- -10°C To +60°C Compensated Temperature Range
- 0.5% Interchangeable
- Solid State Reliability
- Low Power

#### **DESCRIPTION**

The Model SA89VI is a fully piezoresistive silicon pressure sensor with an ASIC compensation board to normonize the outoput for either 0-10Vdc or 4-20mA output.

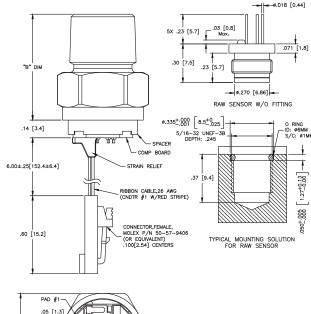

SA89VI High Accuracy Silicon Ceramic sensor is a piezoresistive silicon pressure sensor,offering an 0-10Vdc or 4-20mA output for reading pressure over the specified full scale pressure span and temperature range. SA89VI Series is fully calibrated and temperature compensated for sensor offset, sensitivity, temperature effects, and non-linearity using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure are updated at approximately 50Hz.

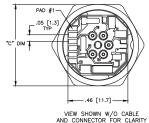

SA89VI Series is calibrated over the temperature range of -10 °C to 60 °C. The sensor is characterized for operation from a single power supply of 16-32Vdc . SA89VI Series sensors are intended for use with corrosive, ionic working fluids. They are designed and manufactured according to standards in ISO 9001.

The products are shipped in anti-static shipping containers. Performance characteristics and packaging can be easily tailored on a special order basis to meet the requirements of specific customers.

#### Notes

- 1.RATIOMETRIC TO SUPPLY CURRENT
- 2.BEST FIT STRAIGHT LINE.
- 3.MAXIMUM TEMPERATURE ERROR BETWEEN 0C AND 50C WITH RESPECT TO 25C.
- 4.SHORT TERM STABILITY OVER 7 DAYS WITH CONSTANT CURRENT AND TEMPERATURE.
- 5.LONG TERM STABILITY OVER A ONE YEAR PERIOD WITH CONSTANT CURRENT AND TEMPERATURE.
- 6.FOR A ZERO-TO-FULL SCALE PRESSURE STEP CHANGE.
- 7.2X MAXIMUM FOR 15000PSI DEVICE.

### **MODEL SA69**

Flexible Electrical Outputs ASIC Compensation Wide Temperature Range Hash Media Compatible

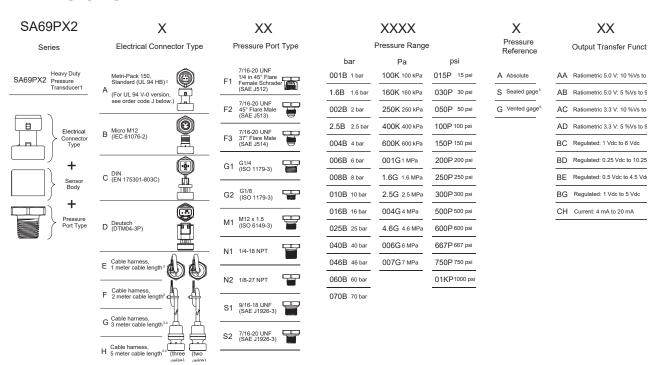

- High Accuracy
- Low Overall Errors, 1%TEB
- All Welded Design
- Custom Outputs and Ranges Available

### **DESCRIPTION**

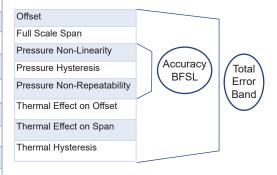

Sensorall SA69 Series incorporates the latest mixed signal ASIC (Application Specific Integrated Circuit) with a bonded silicon gage to provide the standard for Industrial Transducers & Transmitters. The SA69 Series offers current, regulated and ratiometric outputs types along with a wide range of process fittings. The rugged design is compatible with a wide range of harsh media including refrigerants, compressed air, and hydraulic fluids. The designs superior performance provides 1% Total Error across a wide temperature range of -20 to 85°C and overall error of less than 2.5% over -40 to 125C. The flexible design incorporates many connector types making it the ideal choice for OEM customers.

| Long term stability                        | ±0.5 %FSS ° (1000 hr at 25°C [77°F])                                   |
| Accuracy <sup>7</sup>                      | ±0.25 %FSS <sup>9</sup> (See Figure 1)                                 |
| Offset error <sup>8</sup>                  | ±1 %FSS °  |
| Total Error Band <sup>10</sup>             | ±2 %FSS <sup>9</sup> (-40°C to 125°C [-40°F to 257°F]) (See Figure 1.) |
| Response time <sup>11</sup>                | <2 ms  |
| Turn on time <sup>12</sup>                 | <7 ms  |
| Life <sup>13</sup>                         | minimum of 10 million cycles to operating pressure                     |

- 1.All specifications apply at 25°C and under operating conditions unless otherwise noted.
- 2.Operating Temperature Range: The temperature range over which the product will produce an output proportional to pressure but may not remain within the specified

performance limits.

3.Storage Temperature Range: The temperature range over which the product may safely be exposed without excitation or pressure applied. Under these conditions the

product will remain in specification after excursion to any temperatures within this range. Exposure to temperatures outside this range may cause permanent damage to the product.

- 4. Compensated Temperature Range: The temperature range (or ranges) over which the product will produce an output proportional to pressure within the specified performance limits.
- 5. Overpressure: The absolute maximum rating for pressure which may be safely applied to the product for it to remain in specification once pressure is returned to the operating

pressure range. Exposure to higher pressure may cause permanent damage to the product.

6.Burst Pressure: The maximum pressure that may be applied to the product without causing escape of the pressure media. The product should not be expected to function

after exposure to any pressure beyond the rated burst pressure. This rating is also the case burst rating of the product.

7.Accuracy: The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25°C. Includes all errors due to

pressure non-linearity, pressure hysteresis, and non-repeatability.

- 8.Offset Error: the maximum deviation in the output signal obtained when the reference pressure is applied at 25°C relative to the ideal transfer function.
- 9.Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range.
- 10.Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset,

full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span, and thermal hysteresis.

11.Response Time: The response time of the transducer is the maximum amount of time that the transducer will take for the transducer to output a change from 10% to 90% of

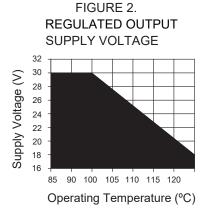

full scale in response to a 0% to 100% full scale step input pressure range.

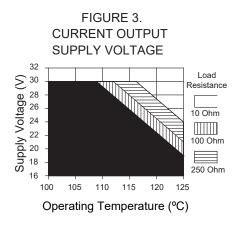

- 12. Turn On Time: Duration from power applied until first valid output.
- 13.Life may vary depending on the application in which transducer is used.

- 1. Output transfer function options are shown in the Nomenclature and Order Guide.
- 2. Transducer will not produce valid output when supply voltage is outside of operating range.
- 3.Applies at 25°C. See Figure 2 for Regulated Output Supply Voltage.
- 4.Applies at 25°C. See Figure 3 for Current Output Supply Voltage.
- 5. Absolute maximum ratings are the extreme limits the device can withstand without damage to the product. Voltages above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.
- 6. Absolute voltage applies to potential across power and ground terminals.
- 7. Short circuit protection between output pin and ground, and output pin and supply pin.
- 8.All EMC ratings verified with the Metri-Pack 150 electrical connector type.

### TABLE3.

| PRESSURE<br>REFERENCE    | DESCRIPTION  |
|--------------------------|--|
| Absolute                 | Output is proportional to the difference between applied pressure and a built-in fixed reference to vacuum (zero pressure), where the minimum operating pressure is set to absolute zero pressure (perfect vacuum)               |
| Sealed gage <sup>1</sup> | Output is proportional to the difference between applied pressure and a built-in fixed reference to 1 atmA, where the minimum operating pressure is set to 14.7 psiA (1 atmA)  |
| Vented gage <sup>2</sup> | Sensor measures pressure relative to ambient pressure. Output is proportional to the difference between applied pressure and atmospheric (ambient) pressure, where the minimum operating pressure is set to atmospheric pressure |

<sup>1.</sup> Sealed gage option only available in pressure ranges at or above 100 psi.

<sup>2.</sup> Vented gage option only available in pressure ranges between 100 psi and 667 psi.

# CAUTION PRODUCT DAMAGE DUE TO MECHANICAL ISSUES

- Ensure torque specifications are determined for the specific application. Values provided are for reference only. (Mating materials and thread sealants can result in significantly different torque values from one application to the next.)
- When using mating parts made of stainless steel, use a thread sealant with anti-seize properties to prevent thread galling. Ensure the sealant is rated for the application.
- Use appropriate tools (such as an open ended wrench or deep well socket) to install transducers.
- Always hand-start transducers into the hole to prevent cross threading and damage.
- Ensure that torque is not applied to the electrical connector.
- Ensure that the proper mating electrical connector with a seal is used to connect the transducer. Improper or damaged seals can compromise ingress protection, leading to short circuits.

Failure to comply with these instructions may result in product damage.

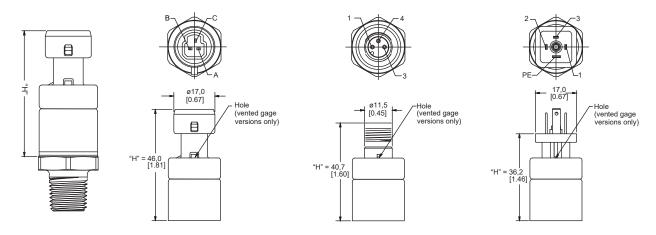

# CAUTION PRODUCT DAMAGE DUE TO PARTICULATES

- Ensure that a filter is used upstream of the transducer to keep media flow free of larger particulates and increased humidity. All PX2 Series transducers are dead-ended devices; particulate accumulation and condensing moisture may affect sensor output.
- It is recommend that the transducer be positioned with the port facing downwards; any particulates in the system are less likely to enter and settle within the pressure transducer if it is in this position.
- Ensure that the media does not create a residue when dried. Build-up inside the transducer may affect transducer output; rinsing of a dead-ended transducer is potentially difficult and has limited effectiveness in removing residue. Failure to comply with these instructions may result in product damage.

LCD Display
Zero Temperature drift
Auto-Zero with Solenoid Valve
4-20mA or 0-10Vdc or 0-5Vdc
RS485 Output

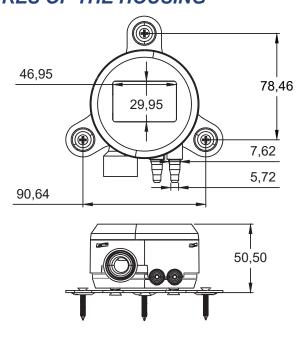

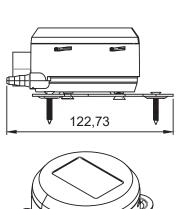

- Clean Room/ HVAC
- Hospital Operating Room
- Environmental Control
- Process Automation Control

### **Characteristics**

- Ranges from 25 Pa to 300psi ( or can be customized, contact factory)
- Configurable intermediary ranges
- 0-5 V, 0-10 V,RS485 or active 4-20 mA output, power supply from 15 to 35 Vdc
- WIFI configurable with local server for remote monitoring.
- ABS V0 housing, IP65, with or without display
- "1/4 turn" system mounting with wall-mount plate
- Housing with simplified mounting system
- Solenoid valve for auto-calibration
- Relay output, alarm pressure level configurable

### FEATURES OF THE HOUSING

### PART NUMBER ORDERING

| SA730DI-        | XXXX -  | D               |
|-----------------|---|-----------------|
| Model<br>Number | Pressure range  | Pressure Type   |
|                 | 0100: -100/+100Pascal                                     | D: Differential |
|                 | 0500: -1000/+1000Pascal                                   | G: Gauge        |
|                 | 010K: -10000/+10000Pascal                                 | A: Absolute     |
|                 | 100K: 100KPa, contact factory for customization if needed |                 |

### **AUTO CALIBRATION**

Pressure transmitter has a temperature compensation from 0 to 50°C and an auto calibration process that guarantees excellent stability and perfect reliability of the measurement on low and high ranges over time.

Auto calibration principle: the microprocessor of the transmitter drives a solenoid valve that compensates the possible drifts on the sensitive element over time. The compensation is performed by the permanent adjustment of the zero, so the measurement of the differential pressure is then independent from the environmental conditions of the transmitter.

Advantage: No drift

Frequency of auto-calibration: Resettable from 1min to 60min

### RANGE CONFIGURATION

The range of the pressure transmitter can be configured according to user's application.

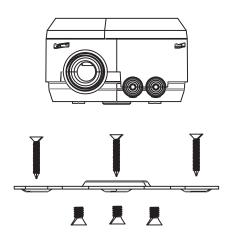

The configurable percentage can be set is 10%,20%,40%,60%,80% within menu.

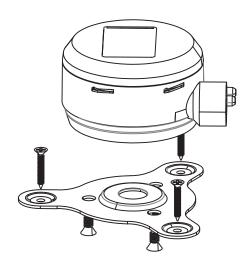

For example, the original range is +/-1000Pa, if select 10%, the range will change to +/-

100Pa, the corresponding 0-5V,0-10V and 4-20mA output will change automatically.

For detailed instruction for the range configuration, consult factory.

### **Mounting**

## **MODEL SA730DI**

Segment Screen Display 4-20mA Output Wide Temperature Range Low temperature to -45degC

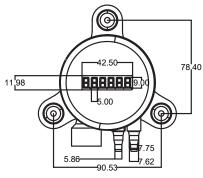

- Cold storage room
- Cold-chain transportation
- Clean Room/HVAC
- Process Automation

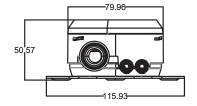

### **Characteristics**

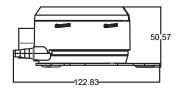

- Ranges from 100 Pa to 150psi (or can be customized, contact factory)
- 2 wires 4-20 mA output, power supply from 12 to 30 Vdc
- ABS V0 housing, IP64, with or without display
- Expansion screw mounting with wall-mount plate
- Housing with simplified mounting plate
- 0.5% Full Scale Span Accuracy
- Operating temperature from -45°C to 70°C with 6 digits segment code screen display
- Storage temperature -55°C to 85°C

### Mounting

## **MODEL SA950W**

Pressure generator
High accuracy
Zero calibration
Multiple pressure range

- Hospital blood pressure calibration
- Incoming inspection tool
- Design validation tool
- Production process control

#### **DESCRIPTION**

SA 950W is a micro pressure controller with LCD display, it can generate -70 to 200Kpa pressure through its internally embedded pressure pump with accurate pressure sensor. Pressure range can be customized, minimum 2KPa and maximum 200KPa, vacuum pressure can be reached to -70Kpa, pressure unit can be customized also. The internal standard pressure sensor can be used to calibrate the pressure output or as reference.

#### **APPLICATION**

SA950 Micro Pressure Controller can be conveniently used within product development, quality control and filed calibration. It is extremely helpful to check the linearity, hysteresis, zero output, full scale output, repeatability and stability of the device under test.

SA950 can also be sued to verify the proper function of blood pressure transducer, reusable cable and monitor integrity during the application in ICU and surgery room.

## **MODEL SA950W**

PRESSURE RANGE:-70 to 200Kpa, Can be customized

OPERATING TEMPERATURE:5°C to 40°C (41°F - 105°F)

STORAGE TEMPERATURE:-20°C to 60°C (-5°F to 140°F)

OPERATING HUMIDITY:RH95% Max.

LCD DISPLAY: 4 DIGITS

DIMENSION: 160mm x 95mm x 35mm

WEIGHT:350 GRAMS

POWER:9VDC Battery( Around 80 Hours Continuously)

#### STANDARD PRESSURE SENSOR PARAMETERS

• SENSITIVITY: 5  $\mu$ V/V/mmHg, +/- 1%

• POWER SUPPLY: 2 to 10 vdc, or vac rms to 5 khz

• INPUT RESISTANCE: 2000-4000  $\Omega$ 

• OUTPUT RESISTANCE: 800-3000  $\Omega$ 

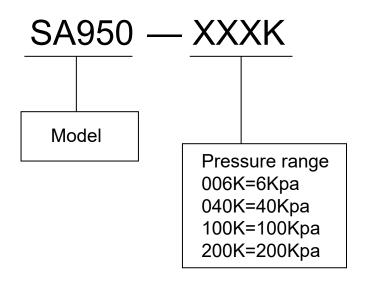

Warning: Discontinue use if liquid is spilled on device.

Warning: Pressure exceeding 200Kpa will cause leak, unstable pressure output and difficult to achieve the targeted pressure.

Warning: To gain as much as positive pressure capability, move the pressure regulator knob to a starting position which is further away from the housing. To gain as

much as negative pressure capability, move the pressure regulator knob to a starting position which is closer to the housing.

#### ORDERING INFORMATION

## **MODEL SA1901**

Small Low Noise

**Robust: High Over-Range** 

**High Reliability** 

mV Output: 20mV/V Nominal

**Low Deflection** 

**Fast** 

**Essentially Unlimited Cycle Life** 

- Assembly Forces
- Physical Therapy Devices
- Patient Weight
- Hand Tool Forces
- Chiropractic and Exercise Equipment
- Consumables Monitoring: Copy Equipment and Vending systems
- Appliance Payload Monitoring: Washers, Dryers, Water Weight, Extraction Efficiency
- Appliance Unbalance Monitoring

### **DESCRIPTION**

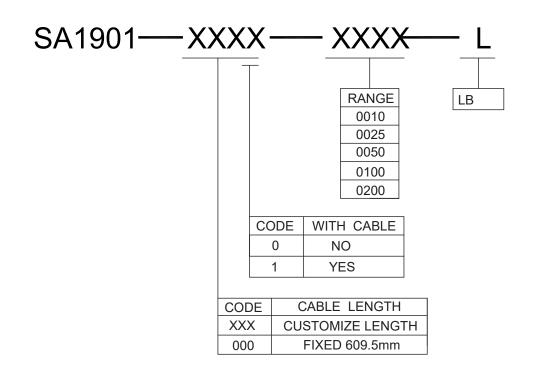

The SA1901 units are intended for OEM use in laboratory, hospital or consumer product applications, establishing a breakthrough price/performance value for silicon on metal force sensors. The SA1901 is a 1% force device with full scale ranges of 10, 25, 50 or 100 and 200lbf compression. This new, low-cost technology enables force sensing in a whole new class of consumer and medical products. Sensorall's silicon on metal MEMS sensing fused with high temperature glass to a high performance stainless steel force measuring flexure. The designed process eliminates age-sensitive organic epoxies used in traditional force sensor designs, providing excellent long term span and zero stability. Operating at very low strains and provides an essentially unlimited cycle life expectancy, superior resolution, high over-range capabilities and a ratiometric span of 20mV/V. The combination of stamped flexures and micro miniaturized MEMs strain gages permits low costs to be achieved in high volume OEM applications ranging from disposable medical devices to durable appliances and exercise equipment.

### PERFORMANCE SPECIFICATIONS

### **DESCRIPTION**

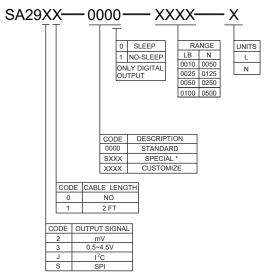

The SA2901 units are intended for OEM use in laboratory, hospital or consumer product applications, establishing a breakthrough price/performance value for silicon on metal force sensors. The SA1901 is a 1% force device with full scale ranges of 10, 25, 50 or 100 and 200lbf compression. This new, low-cost technology enables force sensing in a whole new class of consumer and medical products. Sensorall's silicon on metal MEMS sensing fused with high temperature glass to a high performance stainless steel force measuring flexure. The designed process eliminates age-sensitive organic epoxies used in traditional force sensor designs, providing excellent long term span and zero stability. Operating at very low strains and provides an essentially unlimited cycle life expectancy, superior resolution, high over-range capabilities and a ratiometric span of 20mV/V. The combination of stamped flexures and micro miniaturized MEMs strain gages permits low costs to be achieved in high volume OEM applications ranging from disposable medical devices to durable appliances and exercise equipment.

### PERFORMANCE SPECIFICATIONS

UNLESS OTHERWISE SPECIFIED: ALL PARAMETERS ARE MEASURED AT 25°C @5V:

| PARAMETERS                | MIN   | TYP  | MAX  | UNITS     | NOTES              |   |  |
|---------------------------|---|------|------|-----------|--------------------|---|--|
| RECOMMENDED EXCITATION    | 4.75  | 5    | 5.25 | V         |                    |   |  |

### SA18HD/SA19HD/SA54 Application Notes

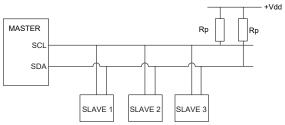

#### 1: I2C Communications

The I2C bus is a simple, serial 8-bit oriented computer bus for effcient I2C (Inter-IC) control. It provides good support for communication between different ICs across short circuit-board distances, such as interfacing microcontrollers with various low speed peripheral devices.

Each device connected to the bus is software addressable by a unique address and a simple Master/Slave relationship that exists at all times. The output stages of devices connected to the bus are designed around an open collector architecture. Because of

this, pull-up resistors to +VDD must be provided on the bus. Both SDA and SCL are bidirectional lines, and it is important to system performance to match the capacitive loads on both lines. In addition, in accordance with the I2C specification, the maximum allowable capacitance on either line is 400 pF to ensure reliable edge transitions at 400 kHz clock speeds.

When the bus is free, both lines are pulled up to +VDD. Data on the I2C bus can be transferred at a rate up to 100 kbit/s in the standard-mode, or up to 400 kbit/s in the fast-mode.

#### 2: I2C Data Transfer

The 24 bits sensors are designed to work as Slaves and will therefore only respond to requests from a Master device. Following the address and read bit from the Master, the sensors are designed to output up to 7 bytes of data. The first data byte is the Status Byte (8-bit) and the second to seventh bytes are the compensated pressure and temperature output (24-bit).

### 3: I2C Pressure and Temperature Reading

Each I2C sensor is referenced on the bus by a 7-bit slave address. The default address for the SA18HD or SA19HD or SA54 is 40 (0x28). Other available standard addresses are: 08 (0x08), 40 (0x28), 56 (0x38), 72 (0x48), 88 (0x58), 104 (0x68), 120 (0x78). (Other custom values are available. Please contact Sensorall Customer Service with questions regarding custom Slave addresses.)

### 4: I2C STATUS BYTE

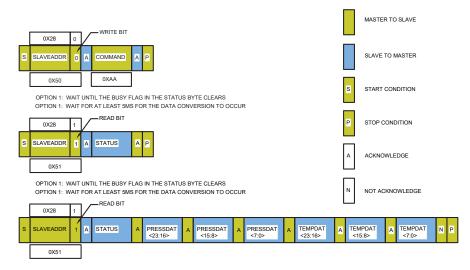

| Bit (Meaning)                   | STATUS  | COMMENT  |
|---------------------------------|---|--|
| 7                               | Always 0  | -  |
| 6 ((Power Indication)           | Device is powered 0: Device is not powered        | Needed for the SPI Mode where the Master reads all zeroes if the device is not powered or in power-on reset (POR).                                 |
| 5 (Busy Flag)                   | 1: Device is busy                                 | Indicates that the data for the last command is not yet available. No new commands are processed if the device isbusy.                             |
| 4                               | Always 0  | -  |
| 3                               | Always 0  | -  |
| 2 (Memory Integrity/Error Flag) | 0: Integrity Test Passed 1: Integrity Test Failed | Indicates whether the checksum-based integrity check passed or failed; the memory error status bit is calculated only during the power-up sequence |
| 1                               | Always 0  | -  |
| 0 (Math Saturation)             | 1: Internal math saturation has occurred          | -  |

## SA18HD/SA19HD/SA54 Application Notes

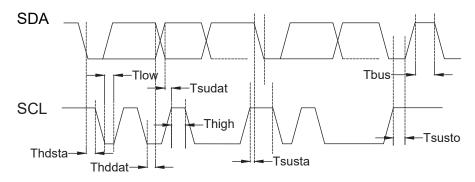

#### 5: I2C communications

#### 5.1 I2C Output Measurement Command

To communicate with the I2C output sensor using an Output Measurement Command of "0xAA", followed by "0x00""0x00", follow the steps shown below. This command will cause the device to exit Standby Mode and enter Operating Mode. At the conclusion of the measurement cycle, the device will automatically re-enter Standby Mode.

#### **5.2 I2C Timing and Level Parameters**

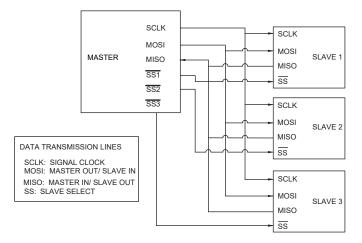

| CHARACTERISTIC   | Abbreviation | MIN. | TYP. | MAX. | UNITS |
|--|--------------|------|------|------|-------|
| SCLK clock frequency                                     | fscl         | 100  | -    | 400  | Khz   |
| Start condition hold time relative to SCL edge           | Thdsta       | 0.1  | -    | -    | uS    |

| Minimum SCLK clock high width                            | Thigh        | 0.6  | -    | -    | uS    |
| Start condition setup time relative to SCL edge          | Tsusta       | 0.1  | -    | -    | uS    |
| Data hold time on SDA relative to SCL edge               | Tsusta       | 0    | -    | -    | uS    |
| Data setup time on SDA relative to SCL edge              | Tsusta       | 0.1  | -    | -    | uS    |
| Stop condition setup time on SCL                         | Tsusto       | 0.1  | -    | -    | uS    |
| Bus free time between stop condition and start condition | Tbus         | 2    | -    | -    | uS    |
| Output level low   | Outlow       | -    | 0    | 0.2  | Vdd   |
| Output level high  | Outhigh      | 0.8  | 1    | -    | Vdd   |
| Pull-up resistance on SDA and SCL                        | Rp           | 1    | -    | 50   | Kohm  |

### SA18HD/SA19HD/SA54 Application Notes

#### 6: SPI COMMUNICATIONS

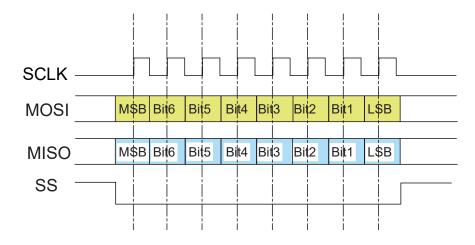

#### 6.1 SPI Definition

The Serial Peripheral Interface (SPI) is a simple bus system for synchronous serial communication between one Master and one or more Slaves. It operates either in full-duplex or half-duplex mode, allowing communication to occur in either both directions simultaneously, or in one direction only. The Master device initiates an information transfer on the bus and generates clock and control signals. Slave devices are controlled by the Master through individual Slave Select (SS) lines and are active only when selected. The SPI sensors operate in full-duplex mode only, with data transfer from the Slave to the Master. This data transmission uses four, unidirectional bus lines. The Master controls SCLK, MOSI and SS; the Slave controls MISO.

#### 7: SPI Data Transfer

Starting communication with the SPI sensors begins by de-asserting the Slave Select (SS) line. At this point, the sensor is no longer idle, and will begin sending data once a clock is received. The SPI sensors are configured for SPI operation in mode 0 (clock polarity is 0 and clock phase is 0). Once the clocking begins, the SPI sensor is designed to output up to 7 bytes of data. The first data byte is the Status Byte (8-bit) and the second to fourth bytes are the compensated pressure output and the fifth to seventh bytes are the compensated temperature output (24-bit).

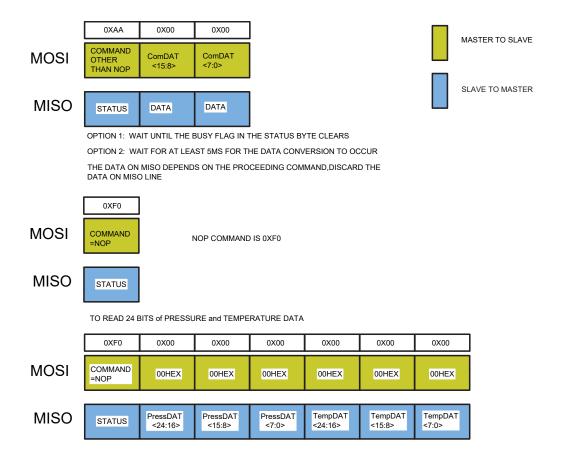

#### 8: SPI PRESSURE READING

To read out a compensated pressure and temperature reading, the Master generates the necessary clock signal after activating the sensor with the Slave Select (SS) line. The sensor will transmit up to 7 bytes of data. The first data byte is the Status Byte (8-bit) and the second to fourth bytes are the compensated pressure output and the fifth to seventh bytes are the compensated temperature output (24-bit). The Master can terminate the communication by stopping the clock and deactivating the SS line.

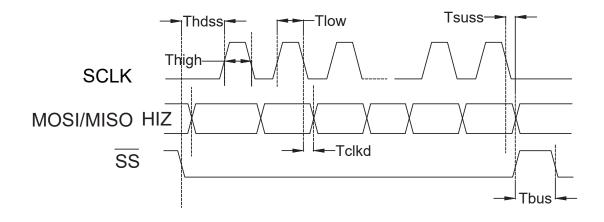

## SA18HD/SA19HD/SA54 Application Notes

#### 9: SPI communications

To communicate with the SPI output sensor using an Output Measurement Command of "0xAA", followed by "0x00" "0x00", follow the steps shown in Table 18 This command will cause the device to exit Standby Mode and enter Operating Mode. At the conclusion of the measurement cycle, the device will automatically re-enter Standby Mode.

### 10: SPI Timing and Level Parameters

## SA18HD/SA19HD/SA54 Application Notes

| Characteristic                            | Abbrievation | Min. | TYP. | Max. | Units |
|---|--------------|------|------|------|-------|
| SCLK clock frequency                      | fscl         | 50   | -    | 800  | Khz   |
| SS drop to first clock edge               | Thdss        | 2.5  | -    | -    | uS    |
| Minimum SCLK clock low width              | Tlow         | 0.6  | -    | -    | uS    |
| Minimum SCLK clock high width             | Thigh        | 0.6  | -    | -    | uS    |
| Clock edge to data transition             | Tclkd        | 0    | -    | -    | uS    |
| Rise of SS relative to last clock edge    | Tsuss        | 0.1  | -    | -    | uS    |
| Bus free time between rise and fall of SS | Tsudat       | 2    | -    | -    | uS    |
| Output level low                          | Outlow       | -    | -    | 0.2  | Vdd   |

### 11: Sensor output calculation

1: Pressure sensor transfer function

Output= (Outputmax-Outputmin)/(Pmax-Pmin) \* (Pressure- Pmin) +Outputmin

2: Rearranging this equation to solve for Pressure, we get Equation

Outputmax= output at maximum pressure [counts]
Outputmin= output at minimum pressure [counts]
Pmax= maximum value of pressure range [bar, psi, kPa, etc.]
Pmin= minimum value of pressure range [bar, psi, kPa, etc.]
Output= pressure reading [bar, psi, kPa, etc.]
Pressure= digital pressure reading [counts]

3: Temperature sensor transfer function

Output= ( OutputdegC+40)\*2^24/125

4: Rearranging this equation to solve for Pressure, we get Equation

OutputdegC= 125\*Output/2^24 -40

Output= digital temperature reading[counts]
OutputdegC= Temperature reading (degree Celsius)

#### 1: I2C Commnications

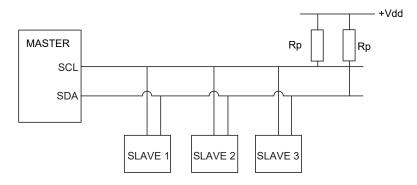

**I2C Bus Configurations** 

The I2C bus is a simple, serial 8-bit oriented computer bus for effcient I2C (Inter-IC) control. It provides good support for communication between different ICs across short circuit-board distances, such as interfacing microcontrollers with various low speed peripheral devices.

Each device connected to the bus is software addressable by a unique address and a simple Master/Slave relationship that exists at all times. The output stages of devices connected to the bus are designed around an open collector architecture. Because of this, pull-up resistors to +VDD must be provided on the bus. Both SDA and SCL are bidirectional lines, and it is important to system performance to match the capacitive loads on both lines. In addition, in accordance with the I2C specification, the maximum allowable capacitance on either line is 400 pF to ensure reliable edge transitions at 400 kHz clock speeds.

When the bus is free, both lines are pulled up to +VDD. Data on the I2C bus can be transferred at a rate up to 100 kbit/s in the standard-mode, or up to 400 kbit/s in the fast-mode.

Each I2C sensor is referenced on the bus by a 7-bit slave address. The default address for the SA18 or SA19 or SA55 is 40 (0x28). Other available standard addresses are: 08 (0x08), 40 (0x28), 56 (0x38), 72 (0x48), 88 (0x58), 104 (0x68), 120 (0x78). (Other custom values are available. Please contact Sensorall Customer Service with questions regarding custom Slave addresses.)

### 2:Retrieving Data

- 2.1: If applicable, include any necessary libraries for I2C communication or other needed protocol with your microcontroller/device.
- 2.2: Assign variables and create any setup features.

i2cv.pressure (14 bit Pressure in counts)

i2cv.temperature (11 bit Temperature in counts)

i2cv.status (2 bit Status)

i2c byte1

i2c\_byte2

i2c\_byte3

i2c\_byte4

2.3: Send I2C initialize command (Initialize I2C bus to set up communication with device)

2.4: Send I2C start command (Send start I2C condition to begin communication with device) i2c start bus()

### SA18/SA19/SA55 14bits Application Notes

2.5: To address and read the Sensorall sensor, the master must write 8 bits total through I2C. The 8 bits consist of the device address and a read command. Send the 7 bit I2C device address command and a least significant bit (LSB) of 1 to tell the master what address to read from. This will give you an 8 bit address with 7 bit part address shifted left and a LSB of 1 added to end of byte. (Please check part data sheet for correct device address.)

```
Device_Read_Byte = (Device Address << 1) + 1;
i2c write(Device Read Byte);</pre>
```

2.6: Read the Sensorall part at the device address to gather measurements. This can be done by setting the master into a receiving state. 4 bytes will have to be read to gather all measurement information. An acknowledge will have to be sent after each of the first 3 bytes and not acknowledge on the fourth byte to stop transmission.

```
i2c_byte1 = i2c_read_ack();
i2c_byte2 = i2c_read_ack();
i2c_byte3 = i2c_read_ack();
i2c_byte4 = i2c_read_nack();
```

2.7: Stop bus, this ends communication with bus, this can be a reset if trying to receive multiple readings. stop\_i2c\_bus();

### 3: Converting Bytes

To collect pressure, temperature, and status, 4 bytes of data have to be read. These bytes will be converted and rearranged to be able to read temperature, pressure, and status of the device. If only 1 or 2 of the 3 device output values are needed, reading less bytes may be sufficient. For example If only pressure is needed, only 2 bytes can be read to obtain the full 14 bit pressure reading.

#### 3.1 Converting Temperature Reading

Temperature conversion consists of a right-shift of the fourth byte by 5 bits (last 5 bits will not contain any data). Then taking the third byte and shifting it left by 3 bits. This is done by multiplying by 8 (8 = 23). Adding both these values together achieves an 11 bit temperature reading.

```
i2c_byte4 >>= 5;
i2cv.temperature = (i2c_byte3 * 8) + i2c_byte4;
```

#### 3.2 Converting Pressure Reading

Pressure conversion consists of left-shifting the first byte by 8, this can be done by multiplying the first byte by 256 (256 = 28), then adding the second byte with eight lower order bits (LSBs) of the full 14 bit pressure reading. A bit-wise AND operation with 3FFF hex is then applied to remove the first two bits that contain part status information by setting those bits to a binary "00".

```
i2cv.pressure = 0x3fff & ((i2c_byte1 * 256) +i2c_byte2);
```

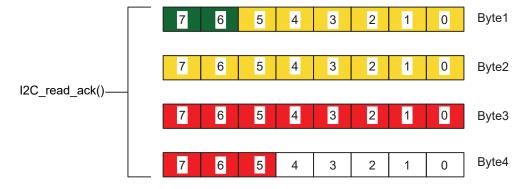

#### 3.4 Converting Status Reading

Status conversion consists of a right-shift of the first byte by 6 bits. This will remove pressure data leaving only the relevant two status bits.

```
i2cv.status = i2c_byte_1 >> 6;
```

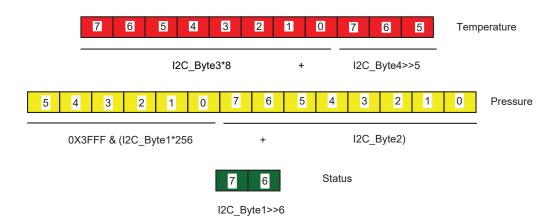

Below is a visual diagram to aid in the process of converting bytes.

Each color represents a different type of bit. Green bits are Status, yellow bits are Pressure, and red bits are Temperature.

## SA18/SA19/SA55 14bits Application Notes

Rearranging these bytes produces 3 outputs, Tempature, Pressure and Status as seen below.

### 4: Handling Data

Once the 4 bytes of data have been rearranged and converted, extrapolate the bytes to be able to achieve data values for the device. Use i2cv.temperature and i2cv.pressure count values from the Sensorall device to calculate actual temperature and pressure values. These calculated values will give temperature in degrees Celsius and pressure in counts or percent full scale (%FS) of the device will need to be converted into unit based values depending on the model number. Refer to data sheet for exact range and limitations of part.

#### 4.1 Pressure Reading

To convert to pressure in the appropriate pressure unit from the byte counts, a line fit from the target count and pressure values has to be created. Creating a line fit from maximum and minimum device points allows for the extrapolation of data values from all count readings.

| Min_Press | Minimum Pressure               |  |
|-----------|--------------------------------|--|
| Min_Press | Maximum Pressure               |  |
| Min_Count | Minimum Pressure count reading |  |
| Min_Count | Maximum Pressure count reading |  |

Pressure Reading = (((max press - min press)/(max count - min count))\* (i2cv.pressure - min count) + min press)

For example using the SA191D-DS5AI-01KDP and inspecting the corresponding data sheet, the maximum and minimum spec count values can be found. The minimum pressure count of 1638 at 10% of the output range and maximum pressure count of 14745 at 90% of the output range. This results in a FS span of 80% of the output range which is equal to 13107 counts. These minimum and maximum relate to -1000Pascal and 1000 Pascal pressure readings for this part, as found in the data sheet. Assuming you receive a count of 8191 from device, the calculations in pascal are as follows.

min\_press =-1000 max\_press =1000 min\_count =1638 max\_count =14745

Pressure in Pascal = (1000 - (-1000))/(14745 - 1638)\*(8191 - 1638) + (-1000)Pressure in Pascal =-0.07Pa

#### 4.2 Temperature Reading

To convert to temperature from byte counts, use the equation below and evaluate it using the counts of i2cv.temperature. The resulting temperature will be in degrees Celsius.

Temperature Reading = (i2cv.temperature/ (2048) \*200) – 50

## SA18/SA19/SA55 14bits Application Notes

Using a count value of 1024 received from the part, the temperature reading of the part can be achieved. The calculations for temperature are as follows.

Temperature in Celsius = (1024/ (2048) \*200) - 50 Temperature in Cerlsius = 50

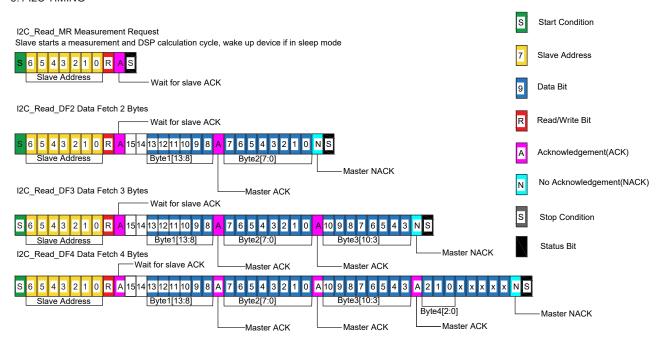

#### 4.3 Status Reading

Sensorall part status consists of 2 bits. These 2 bits gives 4 possible status readings. The 4 status readings are as follows:

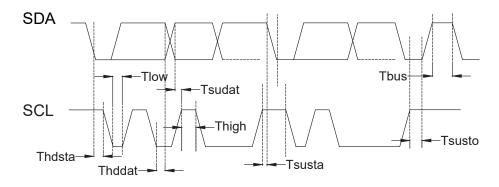

| 00 | Normal Operation            |  |  |
|----|-----------------------------|--|--|
| 01 | Command Mode                |  |  |
| 10 | Stale Data                  |  |  |
| 11 | Diagnostic condition exists |  |  |

#### 6: SPI COMMUNICATIONS

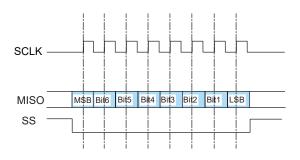

#### 6.1 SPI Definition

The Serial Peripheral Interface (SPI) is a simple bus system for synchronous serial communication between one Master and one or more Slaves. It operates either in full-duplex or half-duplex mode, allowing communication to occur in either both directions simultaneously, or in one direction only. The Master device initiates an information transfer on the bus and generates clock and control signals. Slave devices are controlled by the Master through individual Slave Select (SS) lines and are active only when selected. The SPI sensors operate in full-duplex mode only, with data transfer from the Slave to the Master. This data transmission uses four, unidirectional bus lines. The Master controls SCLK, MOSI and SS; the Slave controls MISO.

#### 7: SPI Data Transfer

Starting communication with the SPI sensors begins by de-asserting the Slave Select (SS) line. At this point, the sensor is no longer idle, and will begin sending data once a clock is received. The SPI sensors are configured for SPI operation in mode 0 (clock polarity is 0 and clock phase is 0). Once the clocking begins, the SPI sensor is designed to output up to 4 bytes of data. The first data byte is the Status Bits (2-bit) of the first byte and the rest bytes are the compensated pressure output and the third to fourth bytes (first 3 bits) are the compensated temperature output (11-bit).

## **PRESSURE**

## SA18/SA19/SA55 14bits Application Notes

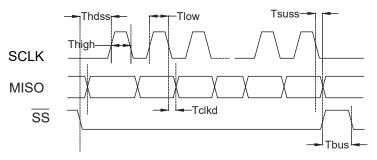

#### 8: SPI Reading

To read out a compensated pressure and temperature reading, the Master generates the necessary clock signal after activating the sensor with the Slave Select (SS) line. The sensor will transmit up to 4 bytes of data. he first data byte is the Status Bits (2-bit) of the first byte and the rest bytes are the compensated pressure output and the third to fourth bytes (first 3 bits) are the compensated temperature output (11-bit). The Master can terminate the communication by stopping the clock and deactivating the SS line.

#### 9: SPI Communications

To read the SPI sensor, just pull SS low for at least 8uS and then pull it high. Pulling SS high will trigger the product to power on and read the data.

### 10: SPI TIMINg and Leveling Parameters

| CHARACTERISTIC                            | ABBRIEVATION | MIN. | TYP. | MAX. | UNITS |

### 11: Sensor output Caculation

1: Pressure sensor transfer function

Output= (Outputmax-Outputmin)/(Pmax-Pmin) \* (Pressure- Pmin) +Outputmin

2: Rearranging this equation to solve for Pressure, we get Equation

 $Pressure = (Output-Outputmin)^*(Pmax-Pmin)/(Outputmax-Outputmin) + Pmin$ 

Outputmax= output at maximum pressure [counts]

Outputmin= output at minimum pressure [counts]

Pmax= maximum value of pressure range [bar, psi, kPa, etc.]

Pmin= minimum value of pressure range [bar, psi, kPa, etc.]

Output= pressure reading [bar, psi, kPa, etc.]

Pressure= digital pressure reading [counts]

3: Temperature sensor transfer function

## **PRESSURE**

## SA18/SA19/SA55 14bits Application Notes

Output= (OutputdegC+50)\*2048/200

4: Rearranging this equation to solve for Pressure, we get Equation

OutputdegC= 150\*Output/2^11 -50

Output= digital temperature reading[counts]
OutputdegC= Temperature reading (degree Celsius)

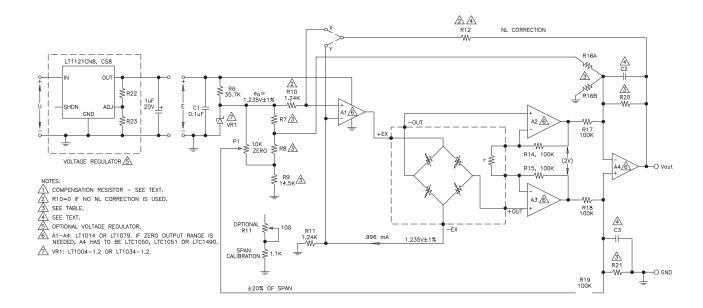

### **Signal Conditioning for Sensorall Pressure Sensors**

#### INTRODUCTION

Piezoresistive pressure sensors provide an analog output signal that is proportional to input pressure. The typical fullscale span for this type of integrated sensor is 100 mV which is sufficient for many applications. Various applications do exist however, that require higher level (e.g. 5 volt) output span and thus bring about the need for gain stages and other signal conditioning circuitry.

Abasic signal conditioning circuit should provide zero balance adjustment, calibration of pressure sensitiv- ity, temperature compensation of zero and span, signal amplification and voltage regulation. In addition to these basic functions, an active nonlinearity correction and fre- quency response shaping may be required to enhance sensor performance.

This application note describes an amplification cir-cuit for temperature-compensated pressure sensors, shown in Figure 1. It provides noninteracting zero and span calibration with a single power supply for three-wire voltage output and two-wire current output configu-rations. This circuit is appropriate for all compensated IC Sensors pressure sensors which utilize constant current excitation (most HIT, TO-8, and ISO products). Several output signal options are shown including live zero (1V) which allows differentiation between transducer failure and zero pressure signal. The circuit consists of the following functional blocks: sensor assembly, reference voltage source, cur-rent source, differential normalizing amplifier, output amplifier, nonlinearity correction loop, frequency response shaping network and optional voltage regulator.

### Signal Conditioning for Sensorall Pressure Sensors

#### SENSOR ASSEMBLY

The sensor assembly consists of a compensated silicon pressure sensor and gain-set resistor r. The gain-set resis-tor normalizes the span of the recommended external amplifier, thus creating a low-cost, interchangeable, high level transducer. Please refer to the product data sheet to determine whether a particular model is uncompensated, has temperature compensation on board, or has tempera-ture compensation plus a gain-set resistor on board. For a detailed discussion of passive temperature compensation, please refer to Application Note TN-002, iTemperature Compensation-IC Pressure Sensors.î For a discussion on interchangeability, see TN-003. iGain Programming Using an IC Pressure Sensor.î

#### **CONSTANT CURRENT SOURCE**

The simplest sensor temperature compensation requires constant current excitation which is built around amplifi-er A1 as shown in Figure 1. The sensor is connected to the feedback loop of the amplifier. The current in this loop is controlled by the reference voltage e0 (neglecting the nonlinearity correction loop) and by resistor R <sup>11:</sup>

$$I = e_0/R_{11}$$

The compliance voltage of this current source is limited by the supply voltage, the output stage saturation of amplifier A1 and the voltage across resistor R11. The required compliance voltage may be derived based on 6.0 kOhm worst case bridge resistance at 25°C and TCR = +0.22%/°C for the compensated sensor. The reference voltage generator is based on the temper-ature compensated bandgap reference diode VR<sub>1</sub>, whose voltage is used to provide a reference for the constant current source. It also provides a reference for the live zero level in the case of 1 to 5Vand 1 to 6Voutput signal levels and a zeroing voltage across potentiometer P¹

#### DIFFERENTIAL NORMALIZING AMPLIFIER

The zero and span temperature compensation for the sen-sor is calculated based on a no output load condition. Since the bridge resistance changes with temperature, an amplifier input resistance that is too low will introduce an additional temperature error. The differential normal-izing amplifier configuration was selected because of its high input resistance and excellent common mode rejec-tion which is virtually independent of circuit component tolerance. The maximum output voltage of this stage is limited by the input common mode voltage. The output of amplifier  $A_2$  is on a common mode voltage level with zero differential input voltage and it can decrease only to the signal common ground level. The worst case com-mon mode voltage at 1.0 mAexcitation current will be about 2.3V in the configuration shown, limiting maxi-mum differential output voltage to about 4.6V. For the circuit shown, a 2.0V span was selected. Gain adjust-ment covers the input signal range from 33 to 115 mV span at 1.0 mAexcitation which corresponds to 50 to 170 mV span at 1.5 mA. Gain K1 is given by:

$$K_1 = 1 + (R_{14} + R_{15})(R_{13} + P_2)$$

K Denoting minimum required gain by G1, maximum required gain by G2 and the available worst case (mini-mum) potentiometer P2 resistance Rp, the value of sym-metrically distributed resistors R14=R15 as well as gainadjustment stop R13 may be calculated as follows:

$$R_{13}=P(G_1-1)/(G_2-G_1)$$
  
 $R_{14}=P(G_1-1)/(G_2-G_1)/2(G_2-G_1)$ 

Common mode rejection (CMR) is relatively important for this stage. Bridge resistance changes with tem-perature from 0.22%/°C for compensated sensors to 0.27%/°C for uncompensated sensors. Thus, bridge volt-age will change with temperature in the constant current excitation mode. For the worst case condition, including 100°C temperature span, the common mode voltage would change by about 0.66V for compensated sensors. Assuming 90 dB worst case differential CMR for this stage (using LT1014), this change would introduce a sensor span. 0.042%/100°C zero error based on a 50 mV

#### TRANSDUCER CIRCUIT

The differential offset temperature drift of amplifiers  $(A_2-A_3)$  creates an attendant change in the zero tempera-ture error of the transducer. For example, the LT1014 amplifier has a worst case differential offset drift of 5  $\mu$ V/° C which translates into a 1%/100° C zero error, assuming a minimum span of 50 mV.

### Signal Conditioning for Sensorall PressureSensors

#### SECOND STAGE AMPLIFIER

The fixed gain output amplifier has two differential inputs. The first input (R17, R18) processes the output from the normalizing amplifier. The other input (R16, R19) is used to generate a zero bias level for the output options with live zero and provides fine zeroing adjust-ment of  $\pm 20\%$  of the sensor span. Since zeroing is done in the first stage, the change of zero does not affect span.

The gain K<sub>2</sub>of the second stage is set by:

$$K_2 = R_{20}/R_{17} = R_{21}/R_{18}$$

Common mode rejection of this stage is more important than in the first stage. The common mode voltage change is still  $0.66\text{V}/100^\circ\text{C}$  worst case at the input( $R_{17}/R_{18}\text{resistors}$ ). With ±1% tolerance of feedback resistors, about 28 dB CMR may be expected (worst case). That translates to a  $1.3\%/100^\circ\text{C}$  worst case zero drift at the output due to common mode voltage change. With better matching of the feedback resistors, this error decreases and the typical error is about two to four times better than the maximum one. The temperature drift of the offset voltage is not criti-cal here. Assuming 5  $\mu\text{V}/^\circ\text{C}$  drift over the  $100^\circ\text{C}$  temper-ature range, the output zero change is only  $0.025\%/100^\circ\text{C}$  based on 2V input span.

#### **NONLINEARITY CORRECTION**

The optional nonlinearity correction loop is established by resistor  $R_{12}$ . This loop feeds back the output voltage in order to control the bridge voltage, thus creating a sec-ond order pressure related component in the output sig-nal. This feedback is used to compensate for the sensorís pressure nonlinearity. For sensors with positive nonlinearity (Figure 2), the feedback is connected to the noninverting input X of amplifier  $A_1$ . For negative nonlinearity, the feedback is connected to the inverting input Y. The value of the feedback resistor  $R_{12}$ may be calcu-lated using the following formula:

where: A=1.9074 B=0.97242

R- value of resistor  $R_{10}$ or  $R_{11}$ , whichever is connected to resistor  $R_{12}$  for given feedback configuration

S - output signal span ( $V_2$ - $V_0$ )) driving resistor  $R_{12}$ :
 4V for 1 to 5V output
 5V for 1 to 6V and 0 to 5V outputs
 10V for 0 to 10V output

NL- absolute value of terminal based nonlinearity expressed in % of span (Figure 2):

NL= 
$$\frac{100[V_1-(V_2-V_0)(P_1-P_0)/(P_2-P_0)-V_0]}{(V_2-V_0)}$$

$$NL = \frac{100[V_1-(V_2-V_0)(P_1-P_0)/(P_2-P_0)-V_0]}{(V_1-V_0)}$$

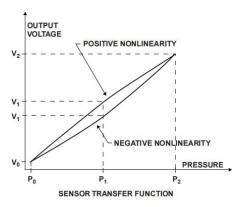

Figure 2. Sensor Transfer Function

#### **FREQUENCY RESPONSE**

Frequency response may be shaped by capacitors C2 and C3. The corner frequency for 3 dB drop of sensitivity is given by:

$$f = \frac{1}{2}pC_2R_{21}$$

with the assumption that  $C_2=C_3$  and  $R_{21}=R_{20}$ . Shaping the frequency response is commonly used to filter out unwanted high frequency noise.

#### **VOLTAGE REGULATOR**

The optional voltage regulator (LT1121) provides protection against reverse polarity connection. The device includes current limiting, thermal limiting and shutdown. It extends the operating voltage range and provides for additional voltage regulation making the output inde-pendent of the amplifiers power supply rejection ratio. The output voltage is set by resistors  $R_{22}$  and  $R_{23}$  accord-ing to the formula:

Vout= $3.75V(1+R_{22}/R_{23})$ 

### **Temperature Compensation Sensorall Pressure Sensors**

#### **RATIOMETRIC APPLICATIONS**

#### **ADDITIONAL INFORMATION**

For ratiometric applications, the optional voltage regula-tor should not be used, and reference diode VR1 should be replaced by a resistor. The value of this resistor should not deliver a higher voltage than 1.26V across it at maximum operating power supply voltage in order to avoid saturation of the amplifiers. Typical performance when using the LT1014 amplifier, is shown in Table 1.

Adetailed discussion on sensor compensation techniques (calculating the temperature compensation resistors and the gain-set resistor) can be found in Application Notes TN-002 and TN-003. For other output options, including 4-20mA, please refer to Application Notes APP103 to APP105.

Table 1. Typical Performance

|  | WITHOUT VOLTAGE REGULATOR |            | WITH VOLTAGE REGULATOR |            |           |

1 Function of Power Supply Rejection rate for the amplifier

#### INTRODUCTION

Advancements in microelectronic technology have pushed silicon sensors not only toward greater sophistication and lower functional cost but also in the direction of higher performance. The major factor affecting high performance applications is temperature dependence of the pressure characteristics. This technical note describes one method of compensa-tion for temperature dependence. Also note that IC Sensors also offers factory compensated versions of several sensor products.

#### **INTEGRATED SENSOR DESIGN**

In one of the IC Sensors designs, a mechanical spring element in the form of a rectangular diaphragm, which converts pressure into strain, is integrated into the silicon. To fabricate the diaphragm (Figure 1a), a selective anisotropic etching technique is used which simultaneously produces a large number of diaphragms on a single silicon wafer. In order to isolate the sensing element from package stress, a pyrex constraint plate is bonded to the diaphragm plate. If this constraint plate has an etched hole, then the diaphragm is subjected to the differential input pressure  $P_1$ - $P_2$ . If the constraint plate has no hole, then the diaphragm is subjected to the differential pressure  $P_1$ - $P_2$ , where  $P_2$  is the pressure at which both plates were sealed together.

To measure the stress in the N-type silicon diaphragm, four P-type resistors (strain gages) are used.

Strain gages result from a selective diffusion of boron into the silicon diaphragm (Figure 1b), a process used in the fabrication of monolithic integrated circuits. The bonding between the four strain gages and the diaphragm is done through the atomic structure of sili-con. This type of bonding eliminates creep, which is the major source of instability in metallic or bonded types of strain gage sensors

The interconnections between strain gages is accomplished with low resistivity P+diffused layers. This approach helps minimize thermal hysteresis effects.

The electrical insulation (passivation) of the diffused resistors and protection of the conductive diaphragm from input media is provided by a thin layer of silicon dioxide grown on both sides of the diaphragm.

IC Sensors provides several package styles for mounting the sensors and applying pressure. The HIT and TO-8 products could be mounted to printed circuit boards in applications where dry noncorrosive gases are used as media. The isolated diaphragm (ISO) products may be mounted by O-Ring, welding or standard process fitting in applications where liquids or corrosive media are used. Please see the individual data sheets for media compatibility.

Adifferential pressure across the diaphragm develops a strain field in such a fashion that a part of the diaphragm is in compression and part is in tension. Two of the strain gages are located in an area of compression and the other two in an area of tension. Electrically they are interconnected into a fully active Wheatstone bridge configuration to maximize the output signal (Figure 1c).

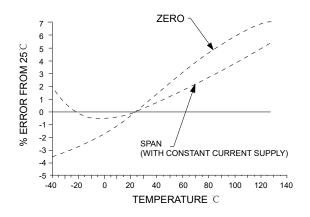

Figure 1. Sensor Structure and Circuit

## TEMPERATURE CHARACTERISTICS OF A SENSOR

Change in ambient temperature results in a correspon-ding change in three sensor parameters: zero pressure output voltage, pressure sensitivity (span), and bridge resistance. These characteristics are shown for a typical sensor in Figures 2 and 3 where zero and span errors are expressed in percent of span at 25°C.

Zero pressure output voltage represents the bridge output voltage without any input pressure. Initial polarity of zero at reference temperature usually enforces the slope of the zero change with temperature, e.g. positive offset tends to increase when the temperature increases, but the correlation is not always a strong one.

Figure 2. Temperature Dependence of Zero and Span

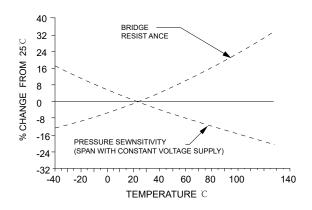

Pressure sensitivity is the normalized span in the voltage excitation mode and is expressed as mV(of span)per one volt (of bridge voltage) per one PSI (of applied pressure). It is independent of the type of supply (voltage or current) or pressure range. This sensitivity or gage factor exhibits a negative temperature slope, decreasing with increasing temperature.

The span is defined as the change of the bridge output voltage from full pressure to low pressure. Span change with temperature is a function of the excitation mode. For a given sensor the span S is a product of normalized pressure sensitivity G, bridge voltage Vb and rated pressure P:

#### S = G.Vb.P

Figure 3. Temperature Dependence of Bridge Resistance

#### and Pressure Sensitivity

In the constant voltage excitation mode the span temperature coefficient is negative (Figure 3) and directly proportional to pressure sensitivity. It is typically -0.21%/°C for IC Sensors'5  $k\Omega$  process.

In the constant current (I) excitation mode the bridge voltage is proportional to the bridge resistance Rb and span can be expressed as:

$$S = G.Rb.I.P$$

Since bridge resistance changes with temperature, the span temperature error is a superposition of both the pressure sensitivity and the bridge resistance tempera-ture coefficients (Figure 3). For IC Sensors 5k, process, the bridge resistance temperature coefficient (TCR) prior to compensation is typically +0.26%/°C. Including a negative temperature coefficient of pressure sensitivi-ty (TCG) of -0.21%/°C, a typical constant current span temperature coefficient is about IC Sensors has opti-mized several products for other TCR & TCG values. These values are controlled by the ion implant dosages that are used to created strain gage resistors. Please see the individual product data sheets for more information.

For a compensated sensor, which is discussed in more detail in the zero and span sections, the effective TCR is reduced to TCG in amplitude when resistor R5 is added (Figure 8). The temperature sensitivity of bridge resistance is a key design factor in the tempera-ture compensation of IC Sensor products.

#### **ZERO COMPENSATION**

Zero pressure output voltage (offset) compensation includes both initial (25°C) offset compensation and temperature error compensation.

Offset compensation includes resistors  $R_3$  and  $R_4$  (Figure 4). If the offset is positive (+O potential at pin 4 higher than -O potential at pin 10) then insertion of resistor  $R_4$  will bring the offset to zero and resistor  $R_3$  should be shorted. When the offset is negative the reverse is true. These resistors do not change the temperature coefficient of zero in constant current mode (Figure 10).

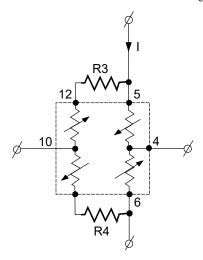

Figure 4. Offset Compensation

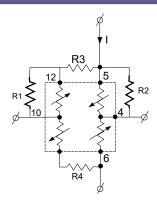

Figure 5. Offset TC

When the temperature coefficient (TC) of offset is positive (+O potential at pin 4 is increasing faster than -O potential at pin 10), a decrease of this TC may be achieved by a decrease of the effective TC of the strain gage connected between +EX pin 12 and -EX pin 10. This may be achieved by a parallel connection of a temperature stable resistor R1 (Figure 5). With a negative coefficient of offset voltage, the decrease of the TC of the other arm will be accomplished by resistor R<sub>2</sub>. Only one of these resistors is used for a given sensor, but both of them affect the initial offset, and the value of resistor R<sub>3</sub> or R<sub>4</sub> has to compensate for this change. During standard production testing IC Sensors uses at minimum 3 test temperatures. Based on measured data the computerized sensor model is developed and a set of simultaneous equations is solved which gives the value of the compensating resistors which bring the off-set to zero at reference temperature T r(Figure 6) and equalize the errors at temperatures T c and Th. This error is a function of the temperature nonlinearity of zero. For sensors with perfectly linear temperature coefficient of offset, the errors at T c and T h will also be zero.

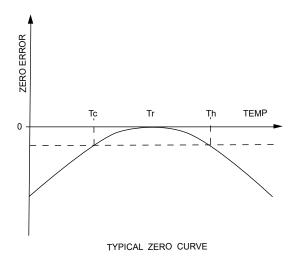

Figure 6. Typical Zero Curve

For standard TO-8 products,  $T \circ = 0^{\circ}C$ ,  $T r = 25^{\circ}C$ ,  $T h = 50^{\circ}C$ . The typical value of zero pressure output error at both cold and hot temperatures is 0.1% of span. Most of it is due to thermal nonlinearity. In practical applications, inaccuracies in the resistors used for compensation contribute at least this amount of error.

It should be noted that the offset voltage of a bridge is not perfectly proportional to the excitation current. Due to self heating effects the change of excitation current may result in a change of zero pressure output voltage, typically a few hundred microvolts, for a compensated unit.

#### **SPAN TEMPERATURE COMPENSATION**

The simplest temperature compensation of span can be achieved by a combination of special wafer processing and constant current excitation. In this mode the span change is a superposition of pressure sensitivity and bridge resistance temperature coefficients. Since these coefficients have different polarities, making them equal in amplitude makes the span internally compensated. The processing required for this type of self compensation limits the cold compensated temperature range due to the nonlinearity of bridge resistance at low temperatures.

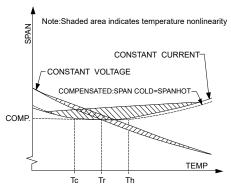

Figure 7. Span vs. Temperature

IC Sensors has developed a process which produces a higher value of bridge resistance temperature coefficient (TCR) than the absolute value of pressure sensitivity temperature coefficient (TCG). Thus in constant voltage mode the span will have a negative TC and in the constant current mode the span will have a positive TC (Figure 7). By decreasing the input resistance of the sensor bridge (Figure 8) with resistor  $R_{\mbox{\tiny 5}}$  in parallel to the bridge for constant current operation (or by increasing the input resistance of the sensor bridge with resistor  $R_{\mbox{\tiny 5}}$  in series with the bridge for constant voltage operation) the temperature compensation condition can be achieved.

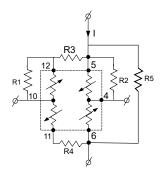

Figure 8. Span TC

The median optimum value of  $R_{\text{5}}$  resistor for IC Sensors 5  $k\Omega$  process is equal to 6.6 times the bridge resistance, or 33  $k\Omega$ , at 25°C. For a given excitation level this resistor will decrease the output span. For constant current excitation the median loss of uncompensated sen-sor output will be only 13%. For the same condition, con-stant voltage excitation would yield an 87% loss of uncompensated sensor output to achieve temperature com-pensation. This explains why constant current excitation is recommended for this type of sensor.

Temperature nonlinearity of span in constant current mode (Figure 2) is not as good as for constant voltage (Figure 3). IC Sensors standard compensating algorithm was designed to provide equal span at temperatures T  $\circ$  and T  $\circ$  (0°C and 50°C for standard TO-8 products). Typical constant current mode span error at -40°C is in the range of +3% of span.

The distribution of span error characteristics from unit to unit is much better than the distribution of zero pressure output temperature errors. Implementation of digital correction, based on the deviation from a typical curve and using bridge voltage as a temperature sensor, would yield an additional major improvement.

## REQUIRED PERFORMANCE OF COMPENSATING RESISTORS

The effect of both the tolerance and TCR of these resistors on sensor performance is shown in Figures 9 through 11. A5000 ohm bridge resistance at 25°C with +0.26%/°C temperature coefficient and 15 mV/V/psi pressure sensitivity at 1.5 mAexcitation current with ñ0.21%/°C temperature coefficient is assumed.

The expected resistor ranges are:

For the majority of ranges, 1%, 100 ppm/°C resistors such as RN55D or similar are sufficient for this application.

As an example, let's assume that the computer printout calls for:

 $R1 = 0.5 M\Omega$ 

R2 = Open

R3 = 900

R4 = Shorted

 $R5 = 20 k\Omega$ 

The effect of a 1% tolerance for resistor  $R_1(0.5M\Omega)$  can be estimated from Figure 9. A0.19 mV offset change would occur and a 0.06 mV/50°C offset temperature coefficient would be added. Atemperature coefficient of 100 ppm/°C for this resistor would contribute an additional 0.12 mV/50°C to the offset temperature coefficient.

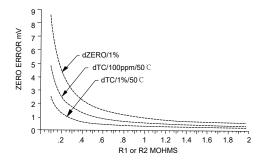

Figure 9. R1 or R2 ResistorTolerance

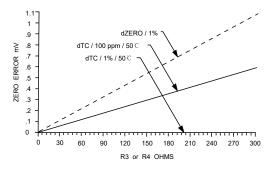

Figure 10. R<sub>3</sub> or R<sub>4</sub> ResistorTolerance

The effect of resistor  $R_3$  (90) can be estimated from Figure 10. The offset would change 0.33 mV for a 1%

resistance deviation and 0.17 mV/50°C due to the effect of 100 ppm/°C temperature coefficient. The off-set temperature coefficient is not affected by the toler-ance of this resistor.

Both of these resistors (parallel:  $R_1$  or  $R_2$  and series:  $R_3$  or  $R_4$ ) affect the span value. Assuming that all strain gages have the same pressure sensitivity, a change of the bridge arm resistance by 1% due to the effect of inserting zero compensation resistors, in turn, changes the span by 0.25%.

Resistor  $R_5$  (20 k) does not effect zero compensation. Span error (Figure 11) introduced by a 1% deviation from the calculated value will be equivalent to a 0.19% span change and 0.02%/50°C of additional span temperature coefficient. Atemperature coefficient of 100 ppm/°C for resistor R5 would introduce an additional span error of 0.15%/50°C.

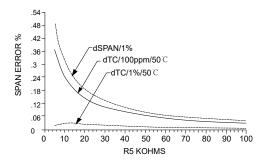

Figure 11. R<sub>5</sub> ResistorTolerance

To minimize the inventory of external compensating resistor values, it is best to calculate the value of the required resistors when a known error can be tolerated. Assume that a 5 mV offset voltage due to tolerance of R1 or R2 resistor can be tolerated. If 0.5 M (R1) is the starting point, with a 0.19 mV/1% offset sensitivity, a 5 mV limit will be reached after 26 increments of 1% (26) (0.19 mV). Raising 1.01 to the 26th power gives a factor of 1.295 which translates to 648 k. At this resistance value the sensitivity of offset to change in R1 is about 0.16 mV/1%, which is equivalent to 31 increments (5 mV/0.16) of 1%. Raising 1.01 to the 31st power gives a 1.361 factor which translates to 882 k (1.361) (648 k). This value would be stocked along with the 499 k resistor for 5 mV zero increments.

This same approach can be applied to all resistors over the entire range and to all specifications including temperature error. In the example above the worst case assumption was made using the highest error for a given resistance range.

## Gain Programming Using an Sensorall Pressure Sensor

Using the average error for a given range would be more realistic (0.18 mV/1% over 500 k to 698 k range), but it leaves no room for variations of sensor performance due to processing tolerances.

## APPENDIX: CALCULATION OF COMPENSATING RESISTOR VALUES

Values of compensating resistors can be calculated based on the results of pressure-temperature testing. The tests include measurements of output voltage (V) and bridge voltage (E) at two temperatures (Tc and Th) and two pressures (P<sub>1</sub> and P2) with constant current (I) excitation:

|         | $T=T_c$                          | $T=T_h$                          |
|---------|----------------------------------|----------------------------------|
| $P=P_1$ | V <sub>0c</sub> , E <sub>c</sub> | V <sub>0h</sub> , E <sub>h</sub> |
| $P=P_2$ | $V_{1c}$                         | $V_{1h}$                         |

Where: V₀c,V₀h₀ zero pressure output voltage, cold andhot respectively

 $V_1c,V_1$ hó full scale pressure output voltage,

andhot respectively

Ec,Ehó bridge voltage, respectively

cold and hot

Tc,Th6 temperature, respectively cold and hot

**ZERO COMPENSATING RESISTORS** 

To calculate zero compensating resistors lets introduce the variables:

$$A = B = A - \frac{V_{0c} + E_c}{I}$$
 
$$\frac{4V_{0c} (V_{0c} + E_c)}{I E_c + 2V_{0c}}$$
 
$$C = \frac{V_{0h} + E_h}{I}$$
 
$$D = C - \frac{4V_{0h} (V_{0h} + E_h)}{I E_h + 2V_{0h}}$$

Asimplified value of offset compensating resistor RS that includes the correction for offset change due to bridge arm loading by resistor R1 or R2 may be calculated now as follows:

$$R^{s}=(A+C-\sqrt{(A+C)^{2}-4\frac{AB(D-C)-CD(B-A)}{D-B}})$$

The calculated value of resistor RS may be either positive or negative. The polarity of this value is utilized to define the position of the resistor. As was discussed before, balancing of offset can be realized by R3 or R4 resistor (Figure 4). The truth table for these resistors is as follows:

when Rs 0 then:
$$R_4=R_s$$
,  $R_3=0$  (shorted)  
Rs < 0 then: $R_3=R_s$ ,  $R_4=0$  (shorted)

The offset temperature slope compensating resistor Rp may then be calculated as follows:

$$Rp = (AB-BRs)/(B-A+Rs)$$

As before, there are two possible positions of Rp resistor:

when 
$$R_P \ge 0$$
 then: $R_2=R_P, R_1=\infty$  (Open)  
 $R_P < 0$  then: $R_1=R_P, R_2=\infty$  (Open)

#### SPAN COMPENSATING RESISTOR

Temperature compensation of span requires one resistor only. Calculating both the span cold (S  $\circ$ ) and hot (S  $^{\rm h}$ ) and the bridge resistance cold (R  $\circ$ ) and hot (R  $^{\rm h}$ )

$$S \circ = V_1 \circ \tilde{n} V_0 \circ ; R \circ = E \circ / I$$
  
 $S \circ = V_1 \circ \tilde{n} V_0 \circ ; R \circ = E \circ / I$ 

We can now calculate the value of span compensating resistor  $R_5$  using the following formula:

It should be noted that the procedure outlined here doesnot include the effects of zero compensating resistors on bridge resistance change, but this effect usually is not critical.

## **Gain Programming Using an Sensorall Pressure Sensor**

#### INTRODUCTION

IC Sensors offers a broad line of pressure transducers with low level output, temperature compensation, and a built-in gain programming resistor.

This laser trimmed resistor programs the gain of an external (customer provided) amplifier to normalize the pressure sensitivity variation of the sensor. This allows the output of the amplifier to be independent of the sen-sor used, providing interchangeability and high level output at very low cost.

This feature is available on all HIT, TO-8, and isolat-ed diaphragm (ISO) products. Please refer to the indi-vidual product data sheets for more information.

#### **BASIC CIRCUIT**

The effective electrical model of the transducer, together with a basic signal conditioning circuit, is shown in Figure 1. The pressure sensor is a fully active Wheatstone bridge which has been temperature com-pensated and offset adjusted by means of thick film, laser trimmed resistors. The excitation to the bridge is a constant current which is supplied through the +EX and -EX pins. The low-level bridge output is at +O and -O, and the amplified span is set by the gain programming resistor (r).

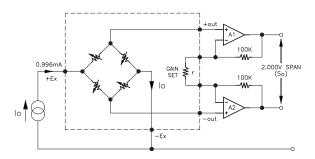

Figure 1. Basic Configuration Gain - Programming Interchangeable Sensor

Resistor r is laser trimmed for each unit using the following algorithm:

where: Si- sensor span value (V) at a reference excitation current (Io = 0.996 mA) r - resistance in  $(k\Omega)$ 

The output span, So, at the differential output of amplifiers A1- A2 (see Figure 1) is then programmed as follows:

$$S_0 = ASi(\frac{r+2R}{r}) = 2A \left[\frac{R}{100} + \frac{SiR(100-R)}{200}\right]$$

where: A=I/Io, ratio of excitation current I to reference current Io (Figure 1)

R - feedback resistors, in  $[k\Omega]$ 

Si - sensor span at the input of the amplifier

If 100k feedback resistors are used, the expression for output span is simplified to:

and is constant for all sensors independent of sensor span Si. The output span is also independent of the pressure range of the sensor. For other values of the feedback resistors (R), the output span (S o ) will vary with the sensor span (S i ). Assuming I = Io , we can calculate S o variations.

Table 1. Output Span (SO) Variation

| R    | SO(Si=40 mV) | SO(Si=90 mV) | SO variation [±%] |
|------|--------------|--------------|-------------------|
| 75K  | 1.5100       | 1.5225       | 0.41              |
| 100K | 2.0000       | 2.0000       | 0.00              |
| 200K | 3.9600       | 3.9100       | 0.63              |

# Gain Programming Using an Sensorall Pressure Sensor

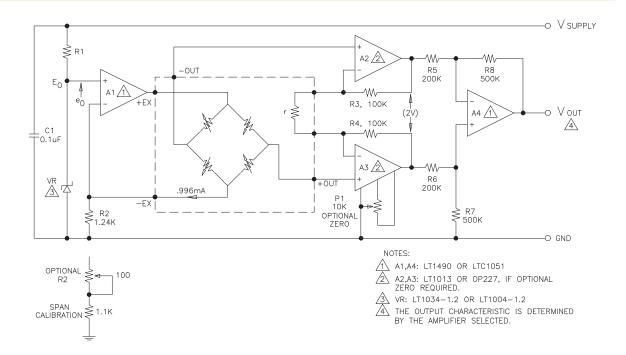

Figure 2. Simple Signal Conditioning Circuit

sAs shown in Table 1, a large deviation from the opti-mum feedback resistance of 100 k can be tolerated while still maintaining transducer interchangeability. For the optimum feedback resistance (100 k), calibration accura-cy is a function of the accuracy of the excitation current, feedback resistors and sensor trimming. The inaccuracy caused by the excitation current and feedback resistors can be made negligible by the use of precision components. Therefore without pressure testing, a 1% system accuracy can be achieved. The standard gain program-ming resistor, r, has a TCR 50 ppm/°C and a trimming range of 2.5 to 12.5 k $\Omega$ . For volume orders, a custom trimming algorithm can be made to achieve any desired output span.

#### SIMPLE SIGNAL CONDITIONING CIRCUIT

The signal conditioning circuit shown in Figure 2 pro-vides a precision constant current source for sensor exci-tation and an instrumentation amplifier with the gain programmed by sensor feedback resister r. To correct for pressure non-linearity or to generate output options other than 0-5V please refer to Technical Note TN-001, iSignal Conditioning for IC Pressure Sensors.î

The current source is controlled by the 1% band-gap reference diode, VR. The reference current I o is defined by:

Io=(Eo- e<sub>0</sub>)R<sub>2</sub>

where: Eo - diode reference voltage: 1.235V  $\pm 1\%$  (LT1034-1.2 or LT1004-1.2) e<sub>0</sub> - offset of amplifier A<sub>1</sub> R<sub>2</sub> - feedback resistor

Selecting amplifier A1 with an offset voltage below 1 mV and a  $\pm 1\%$  tolerance of resister R<sub>2</sub> delivers current Io = 0.996 mAwith a typical accuracy of 1.08%.

The first differential stage of the instrumentation amplifier A2-A3 may have a zeroing potentiometer (P).For 0P227 amplifiers, the zero range is typically 4 mV in reference to the input with a differential offset below 0.5 mV. This leaves about 3.5 mV zeroing range for the compensation of the sensor offset which typically is below 1 mV.

The second stage of the amplifier provides additional amplification R8/R5 and translates the differential floating voltage from the first stage into a single ended output voltage. Modifying equation [3] the expression for over-all span (S) can be found as follows:

#### S=2.A.R<sub>8</sub>/R<sub>5</sub>=5.000V@A=1

The overall accuracy of the span is effected by the accuracy of feedback resisters  $R_3$  through  $R_8$ . Using 0.1% resisters such as Mepco/Electra 5063Z, a typical gain error will be about 0.24%. The accuracy error may be decreased when matched thin film resistors are used such as Beckman 694-3-A. The combined span error of the entire signal conditioning circuit at a reference temperature will then typically be about 1.1%

## Gain Programming Using an Sensorall Pressure Sensor

without any adjustment or pressure testing. This will be superimposed on the sensor's accuracy of 1%.

If additional calibration and normalization are desired, resister  $R_2$  can be replaced with a series combination of a potentiometer and a resistor (Figure 2). The potentiometer can be adjusted to set the bridge excitation current (I) to achieve the exact span voltage (S)with full scale pressure applied to the sensor.

If no pressure source is available, the gain error of the amplifier can be reduced by using the procedure outlined below. This method may be used instead of using the precision resisters discussed above for  $R_2$  through  $R_8$ . The sensor span error of 1% will remain however.

Calibration procedure:

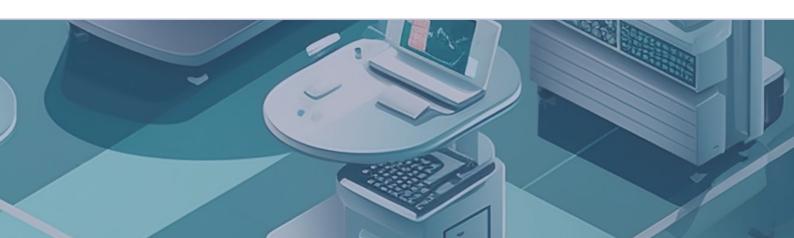

- · replace resistor r with an external resistor  $7.50\Omega k~0.1\%$
- check gain K of the instrumentation amplifier and calculate the gain ratio X (in reference to the ideal gain KO = 69.028V/V) where X = K/KO
- set current IO = 0.996/X(mA) by adjusting the potentiometer, thus completing calibration.

Assuming a 6.4 k $\Omega$  (50°C) maximum bridge resistance, a 0.996 mAbridge current and a 1.2V diode reference voltage, it follows that the maximum output voltage of amplifier  $A_1$  can approach 7.7V. Also, the positive saturation voltage at 1 mAoutput current for the LTC1051 amplifier is 0.5V. Therefore, the minimum excitation voltage, which is a function of the current source and amplifiers used, would be 8.2V(7.7V+0.5V) for the LTC1051. For the LT1490, the minimum excitation voltage should be 7.9V.

The maximum excitation voltage is limited by the voltage handling characteristics of the specific amplifier used.

#### **ADDITIONAL INFORMATION**

For a detailed discussion of the compensation circuit, and for output voltages other than 0-5V, please refer to Application Notes TN-001 and APP-103 to APP-105.

# **APPLICATION NOTES A Simple Pressure Sensor Signal Conditioning Circuit**

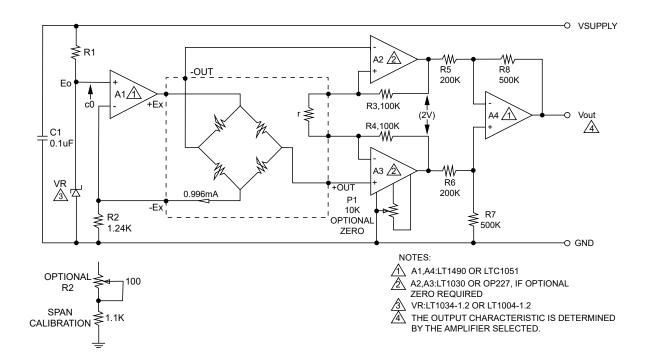

#### INTRODUCTION

Asimple signal conditioning circuit should allow the output of the amplifier to be independent of the sensor used, providing interchangeability and high level output at very low cost. Alaser trimmed resistor on the sensoris compensation board programs the gain of an external amplifier to normalize the pressure sensitivity variation.

#### SIMPLE SIGNAL CONDITIONING CIRCUIT

The signal conditioning circuit shown in Figure 1 provides a precision constant current source for sensor excitation and an instrumentation amplifier with the gain programmed by sensor feedback resistor r.

For a detailed discussion of the compensation circuit, and for output voltages other than 0-5V, please refer to Application Notes TN-001 and APP-103 to APP-105.

# A Simple Pressure Sensor Signal Conditioning Circuit

#### CIRCUIT DETAILS

The current source is controlled by the ±1% band-gap reference diode, VR. The reference current IO is defined by:

$$IO = (EO - eO)/R2$$

where: EO - diode reference voltage: 1.235V ±1% (LT1034-1.2 or LT1004-1.2) eO - offset of amplifier A¹ (~0) R2 - current set resistor

Selecting amplifier A1 with an offset voltage below 1 mV and a  $\pm 1\%$  tolerance of resister R2 delivers current IO = 0.996 mA with typical accuracy of  $\pm 1.4\%$ .

The differential input stage of the instrumentation amplifier, A3-A2 has a gain of Gain=1+(R3+R4)/r.

The gain set resistor r is trimmed for R3=R4=100K and a differential output voltage of 2V.

#### OPTIONAL ZERO ADJUST

If the optional zero adjustment is required, use OP227 amplifiers instead of the LT1013 and add the zeroing potentiometer P1.

The zero range is typically  $\pm 4$  mV referenced to the input with a differential offset below 0.5 mV. This leaves about a  $\pm 3.5$  mV zeroing range for the compensation of the sensor offset which is typically below  $\pm 1$  mV.

#### **OUTPUT**

The output stage of the instrumentation amplifier provides additional amplification R8/R5 and translates the differential floating voltage from the first stage into a single ended output voltage. The equation for the overall output voltage is:

A is the Ratio between the actual excitation current Io and the specified current.

#### **ACCURACY AND CALIBRATION**

The overall accuracy of the span is effected by the accuracy of feedback resisters R3 through R8. Using  $\pm 1\%$  resistors such as Mepco/Electra 5063Z, the typical gain error will be about  $\pm 0.24\%$ . The accuracy error may be decreased when matched thin film resisters are used such as Beckman 694-3-A. The combined span error of the entire signal conditioning circuit at a reference temperature will then typically be about 1.1% without any adjustment or pressure testing. This will be superimposed on the sensorís accuracy of  $\pm 1\%$ .

#### OPTIONAL SPAN CALIBRATION

If additional calibration and normalization is desired, resister R2 can be replaced with a series combination of a potentiometer and a resistor (Figure 1). The potentiometer can be adjusted to set the bridge excitation current (I) to achieve the exact span voltage (S) with full scale pressure applied to the sensor.

#### **GAIN ERROR**

If no pressure source is available, the gain error of the amplifier can be reduced by using the procedure outlined below. This method may be used instead of using the precision resistors discussed above for R2 through R8. The sensor span error of ±1% will remain, however.

#### **Calibration procedure:**

- replace resistor r with an external resistor  $7.50\Omega k~0.1\%$
- check gain K of the instrumentation amplifier and calculate the gain ratio X (in reference to the ideal gain KO = 69.028V/V) where X = K/KO
- set current IO = 0.996/X(mA) by adjusting the potentiometer, thus completing calibration.

Assuming a 6.4 k $\Omega$  (50°C) maximum bridge resistance, a 0.996 mA bridge current and a 1.2V diode reference voltage, it follows that the maximum output voltage of amplifier A1 can approach 7.4V. Also, the positive saturation voltage at 1 mA out-put current for the LTC1051 amplifier is 0.5V. Therefore, the minimum excitation voltage which is a function of the current source and amplifiers used would be 7.9V (7.4V + 0.5V) for the LTC1051. For the LT1490, the minimum excitation voltage should be 7.6V. The maximum excitation voltage is limited by the voltage handling characteristics of the specific amplifier used.

# A Simple Pressure Sensor Signal Conditioning Circuit

#### **OUTPUT SPAN SO VARIATION**

Resistor r is laser trimmed for each unit using the following equation:

where: Si = sensor span value (V) at a reference excitation current (Io = 0.996 mA)

r = resistance in (k)

RF = 100K feedback resistor

V<sub>amp</sub> = amplified output

The output span So at the differential output of amplifiers A<sup>3</sup>- A<sup>2</sup> (see Figure 1) for any other feedback resistor R in  $K\Omega$  is given by:

SO = AS 
$$\left(\frac{r+2R}{r}\right) = 2A \left[\frac{R+R}{100} + \frac{S_i(100-R)}{200}\right]$$

where: A = I/IO, ratio of excitation current I to reference current Io

If 100  $k\Omega$  feedback resistors are used, the expression for output span is simplified to:

$$Sc = 2A$$

and is constant for all sensors independent of sensor span  $S_i$ . The output span is also independent of the pressure range of the sensor. For other values of the feedback resistors (R), the output span ( $S_i$ ) will vary with the sensor span ( $S_i$ ). Assuming I = I $_i$ , we can calculate  $S_i$ 0 variations.

Table 1. Output Span (SO) Variation

| _     |              |              |                   |
|-------|--------------|--------------|-------------------|
| R     | SO(Si=40 mV) | SO(Si=90 mV) | SO variation [±%] |
| 50 K  | 1.0200       | 1.0450       | 1.23              |
| 75 K  | 1.5100       | 1.5225       | 0.41              |
| 99 K  | 1.9804       | 1.9809       | 0.01              |
| 100 K | 2.0000       | 2.0000       | 0.00              |
| 101 K | 2.0196       | 2.0191       | 0.01              |
| 200 K | 3.9600       | 3.9100       | 0.63              |
| 500 K | 9.8400       | 9.6400       | 1.0               |

As seen in Table 1, a large deviation from the optimum feedback resistance of 100 k is tolerable while maintaining transducer interchangeability.

For the optimum feedback resistance (100 k), calibration accuracy is a function of the accuracy of the excitation current, feedback resistors and sensor trimming.

The inaccuracy caused by the excitation current and feedback resistors can be made negligible by the use of precision components. Therefore without pressure testing, a 1% system accuracy can be achieved.

The standard gain programming resistor r has a TCR  $\leq \pm 50$  ppm/°C and a trimming range of 2.5 to 12.5 k. $\Omega$  For volume orders, a custom trimming algorithm can be made to achieve any desired output span.

# **APPLICATION NOTES Microprocessor Compatible Circuit**

#### INTRODUCTION

A simple microprocessor compatible circuit is shown in Figure 1. Amplifiers A1 to A4 form a basic signal conditioning circuit similar to that described in Application Note APP-101, "A Simple Pressure Sensor Signal Conditioning Circuit."

#### **CIRCUIT**

To enable the operation of a single 5V power supply, the current through the sensor has been decreased to 0.66 mA. Furthermore, the voltage across R6 has been decreased to 0.2V (from 1.2V in APP-101), thus allowing increased voltage across the bridge which will be reflected in a higher output span.

#### A/D

The differential output of amplifiers A2 and A3 controls the differential input of analog to digital converter LTC1092.

#### **CALIBRATION**

Sensitivity calibration is achieved by adjusting the reference voltage for the A-D converter through amplifier A4. The span between pins 2 and 3 of the converter will be two times the reference voltage at pin 5.

#### **ADDITIONAL INFORMATION**

A detailed discussion of the temperature compensation circuit can be found in Application Note TN-001, "Signal Conditioning For IC Pressure Sensors."

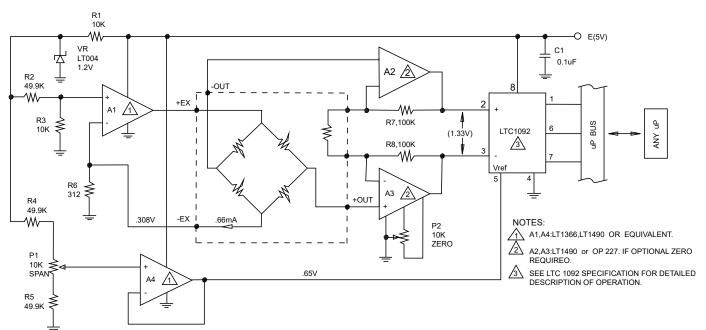

Figure 1. Transducer Circuit - Two Wire Current Transmitter

# APPLICATION NOTES 4-20 mA Circuit

#### INTRODUCTION

A signal conditioning circuit for a two-wire 4 - 20 mA transmitter is shown in Figure 1. Two-wire transmitters are used when the pressure sensor is far away from its associated display or meter, since transmitters are unaffected by voltage drops along the supply and signal lines.

#### **CIRCUIT DESCRIPTION**

The two-wire operation is achieved by referencing all signals to the emitter of transistor Q2. Feedback resistors R11 - R12 control the voltage across resistor R14, drawing a constant current from the input terminals.

#### **CALIBRATION**

Zero adjustment is achieved by applying the voltage at the slider of potentiometer P1 to the second differential input of amplifier A4, created by resistors R7 - R10. Span calibration is realized by bridge current change using potentiometer P2.

#### **FREQUENCY RESPONSE**

Frequency response may be shaped by capacitors C1, C2 with a 3dB frequency, f=1/( $2\pi$ R11C2), where C1=C2, R11=R12, and f is measured in Hz

#### **VOLTAGE REGULATOR**

Sensitivity calibration is achieved by adjusting the reference voltage for the A-D converter through amplifier A4. The span between pins 2 and 3 of the converter will be two times the reference voltage at pin 5.

#### **ADDITIONAL INFORMATION**

A detailed discussion of the temperature compensation circuit can be found in Application Note TN-001, "Signal Conditioning For IC Pressure Sensors."

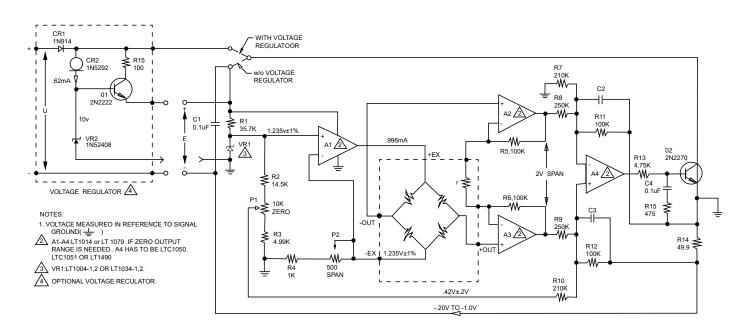

Figure 1. Transducer Circuit - Two Wire Current Transmitter

# Low Component Count, Single Supply 0-5V Output, Pressure Amplifier

#### INTRODUCTION

There are many possible solutions for any given instrumentation amplifier requirement. The circuit in Figure 1 shows a solution that is low in component count, single supply, 0-5 PSI input to 0-5V output, and better than 1% accuracy over 0-50°C.

#### CIRCUIT DESCRIPTION

The circuit divides into the following blocks: sensor (or bridge), current source, amplifier and offset adjust.

The sensor (X1) chosen is 0-5 PSI, grade A, Model 12 by IC Sensors. It is a compensated (for low offset), current driven, bridge type sensor.

Some of the sensor specs are:
Full Scale Output Span 75 mV to 150 mV
Zero Pressure Output 1 mV Max
Input and Output Resistance 2500Ω to 6000
Temperature Coefficient-Span +0.5% Span Max
Temperature Coefficient-Resistance 0.22%/°C Typ
Supply Current 1.5 mA to 2.0 mA Max

Typically, current driven sensors have better temperature characteristics then voltage driven sensors. The current source comprises Q1, R2, R3, U1, and VR1. R2 biases VR1, a reference. U1 regulates the current through R3 by keeping the voltage across it at VR1 voltage level, namely, 2.5V. The current through R3 is practically the collector current of Q1 and the sensor supply current.

The amplifier comprises R6 to R11, U2A and U2A. The gain of the amplifier is 2(1+Rf/Rs) where Rf=R6+R7+R9+R11 and Rs=R8+R10. R10 is a gain adjustment trim-pot. The gain range reflects the large output range of the sensor.

There are three major offset errors in the circuit: bridge offset, amplifier offset, and amplifier common mode that transforms into offset. The common mode offset error can be the worst of the three. The common mode offset error is lowest when R6 and R11 have the

same resistance and when R7 and R9 have the same resistance. Worst case common mode is 41 mV in the output for every volt in the input (all resistors are 1%). Since the input voltage can be as high as (1.5 mA)( $6000\Omega$ )/2 = 4.5V, the common mode offset voltage can be (4.5V)(41 mV/V) = 184.5 mV in the output.

The offset is nulled by R4 and R5. R5ís value is calculated for worst case common mode type offset. R4 is connected across the bridge to compensate for drift caused by the temperature coefficient of the bridge and the common mode of the amplifier. If better adjustment resolution is required of R4, it is possible to increase the value of R5. There may be extremely small number of amplifiers that will not calibrate.

#### Calibration

R12 is added to the circuit for the purpose of calibration. While in operation it can be ignored, in calibration it may bec desired to connect a -0.2 volt source to the Vpin of U2 for adjustment to a true 0V at 0 PSI. Calibrate at room temperature.

#### The calibration steps are:

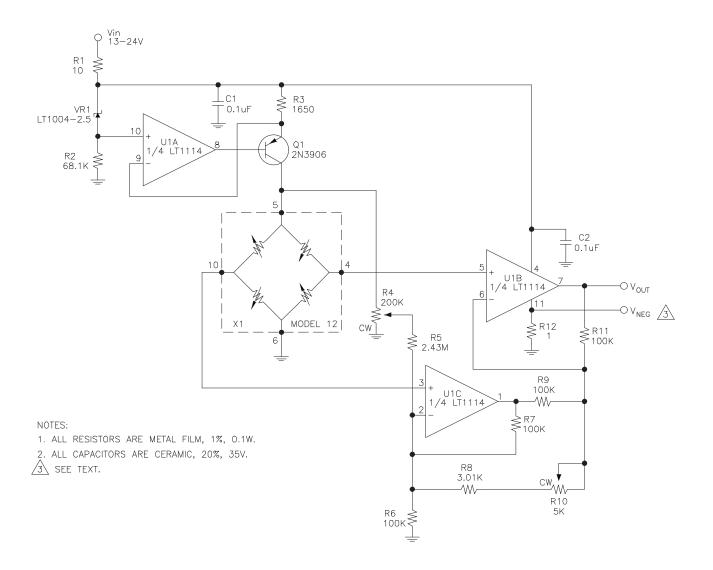

- 1. Connect VIN and VNEG. VNEG can be a 200 mA current sink or -0.2V voltage source.
- 2. At 0 PSI (atmospheric pressure) adjust R4 for 0.0V at Vo.
- 3. Apply 5 PSI pressure source and adjust Vo for 5.0V at Vo.
- 4. Repeat step s 2 and 3 until output reached the desired level of accuracy.

#### **Testing**

#### The calibration steps are:

- 1. Connect VIN and VNEG. VNEG can be a 200 mA current sink or -0.2V voltage source.
- 2. At 0 PSI (atmospheric pressure) adjust R4 for 0.0V at Vo.
- 3. Apply 5 PSI pressure source and adjust Vo for 5.0V at Vo.
- 4. Repeat step s 2 and 3 until output reached the desired level of accuracy.
